## DOODLE NOTES

### GENETIC Evolution

natural selection changes the range of traits in a population - there are 3 ways it can change. Let's look at a moth population that shows

### Evolution by natural selection

Describe the theory of natural selection and how the theory was first conceived (thought of).

An English naturalist named Charles Darwin went on a voyage around the world. He noticed that animals in similar environments had similar characteristics. For example, in the Galápagos islands, Darwin observed similar but non-identical species of finches on each island. He noticed that their beaks seemed to be adapted to their food source. After some time thinking and the work of other scientists, Darwin developed his theory of natural selection.

Individuals with favorable traits survive and reproduce, passing on those traits to their offspring. Over time, the population becomes better adapted to its environment.

**An example of natural selection!**

<p>A population of light brown moths lives in an area of dark wood. They have few birds to eat.</p>	<p>One day a hawk comes to hunt for the common variation.</p> <p>Cool!</p>
<p>Some birds fly to the dark wood.</p>	<p>Light brown moths are more likely to get eaten - they are the birds' favorite!</p> <p>NOOOOOO!!!</p>
<p>The moths with dark fur are camouflage against the dark wood where they live.</p>	<p>A higher proportion of dark moths survive to reproduce, passing on the beneficial trait.</p>

Stabilizing selection

Stabilizing selection represents the graph -  $\sigma^2$

### GENE FLOW

What is it? Movement of genes in or out of a population happens through movement of individuals. This can bring new alleles into a population or change the frequency of existing alleles.

Example: A population of butterflies with a new allele introduced.
