begins with an investigation to learn what is already known and what remains to be learned about a topic through reviewing secondary sources and investigations others have previously conducted in the specified area of interest. Secondary data analysis takes this one step further, including a review of previously collected data in the area of interest. While secondary data analysis is a flexible approach and can be utilized in several ways, it is also an empirical exercise with procedural and evaluative steps, just as there are in collecting and evaluating primary data (Doolan & Froelicher, 2009). Secondary data analysis remains an under-used research technique in many fields, including LIS. Given the increasingly availability of previously collected data to researchers, it is important to further define secondary data analysis as a systematic research method. Yet, few frameworks are available to guide researchers as they conduct secondary data analysis (Andrews et al., 2012; Smith et al., 2011).

3. Process of Secondary Analysis

In conducting research, the area of investigation and the research questions determine the method that the researcher follows. The research method consists of how the researcher collects, analyzes, and interprets the data in the study (Creswell, 2009). Secondary analysis is a systematic method with procedural and evaluative steps, yet there is a lack of literature to define a specific process, therefore this paper proposes a process that begins with the development of the research questions, then the identification of the dataset, and thorough evaluation the dataset. This procedure is illustrated by a LIS research study in which the researcher investigated school librarians as leaders in technology integration.
