The cuticle is a waterproof layer that stops the leaf losing too much water. The palisade cells have lots of chloroplasts to absorb light energy to make photosynthesis happen. Leaves have a large surface area so they can absorb a lot of light energy. Cells in the leaf need to absorb carbon dioxide from the air. Air gets into the leaf through holes in the bottom surface called stomata. Guard cells can close the stomata at night to stop the leaf losing water.

3 Some of the glucose made in photosynthesis is used to make new materials for the plant. Match up the materials with their uses.

Ahrens,1992 The current crisis in clinical research cannot be fully appreciated unless the underlying economic sociological and motivational problems in American medicine are fully understood

Accordingly this important book describes the evolution of biomedical research in relation to changes in institutional perceptions of the importance of each of the three roles that U S medical schools play teaching research and service to patients Ahrens meticulously analyzes seven very different kinds of research activity that are included under the term clinical research He describes the profound shift in emphasis from patient oriented research to research at the cellular and molecular level This shift has created an imbalance between two contrasting research approaches to the problems of human disease reductionism and integrative research In searching out the reasons for this change Ahrens carefully examines institutional supports for clinical research the medical school environment in which the research is carried out and the main funding source the National Institutes of Health This timely work identifies the fundamental differences between reductionism and integrative research and provides clear evidence that if both modes are to prosper in the future as they must then patient oriented research must receive far stronger support from U S medical schools and the N I H Ahrens masterfully argues that changes must be made in the special training of clinical investigators and in their funding requirements and that new working partnerships between clinically skilled M D s and technically trained Ph D s are urgently needed in order to restore patient oriented research to full productivity and to accomplish a re balancing that most effectively assures quality research in the future
