Reading: [Genetic Variation in Cornelian Worksho](#) and genetic variation in [genetics](#) (complete each of the following questions, describing your understanding of the concepts discussed in the lesson)

1. Match each of the following changes in DNA sequence structure to its definition:

A. Deletion

B. Duplication

C. Inversion

D. Translocation

(a. a section of a chromosome is inserted)

(b. a piece of a chromosome is deleted)

(c. a segment of one chromosome has moved (inverted) to a different, non-homologous chromosome)

(d. a section of a chromosome appears to be on one chromosome but is really on another

2. How many genetically different gametes can be produced from a diploid cell with four chromosomes pairs? Describe your answer.

Match the number of genetically different gametes that can be produced to each of 2ⁿ where n is total number chromosomes pairs, a diploid cell with four chromosomes pairs can produce gametes of 16 or 32 genetically different gametes

3. Although your offspring is a combination of both of your genes, you recognize that some traits come from one independent chromosome. (For example, both of your eyes are blue, but your nose and hair are inherited together.)

Match the two traits inherited together and those on the same chromosome. (Example: blue eye inheritance is inherited together, and a curly-haired-boy is only passed with curly hair.)
independent chromosomes from traits will be inherited with curly hair resulting in the parents' parents. (Example: blue eye is inherited together)

4. Describe the alignment of chromosomes during prophase I, write the equations:

homologous chromosomes I homologous chromosomes and homologous chromosomes align together, called bivalents. This is a synaptonemal complex of chromosomes, which are connected and results in the double chromosome.

5. How does recombination lead to chromosomes with recombinant genes? Describe how types of genetic inheritance that can result from recombination.
