

## Extending Mendelian Genetics

### The Chromosome Theory of Inheritance

- Arose out of Sutton and Boveri's observations of meiosis
- States that genes are located on chromosomes at a particular locus
- The physical separation of alleles during meiosis I is responsible for **Mendel's principle of segregation**
  - **Law of segregation**: one character (gene) with 2 traits (alleles). The pairs of alleles are separated during meiosis I in the formation of gametes.
  - The genes for different traits assort independently of one another at meiosis I because:
    - They are located on different non homologous chromosomes
    - They assort independently of one another
      - **Mendel's principle of independent assortment** - two characters, 4 traits

- Two kinds of genetic disorders:
  - Autosomal
    - Autosomal recessive
      - A recessive phenotype shows up in offspring only when both parents have that recessive allele
      - Ex. sickle-cell anemia (crescent-shaped hemoglobin), cystic fibrosis (defective chloride channel, causing damages to lungs, pancreas, etc.)
    - Autosomal dominant - one faulty allele causes a disorder
      - Homozygous or heterozygous individuals will display the trait
      - One heterozygous parent will pass it on to about half of his/her offspring
      - Any child with the trait must have a parent with the trait
