Development and Evaluation of a Calibration and Validation Procedure for Microscopic Simulation Models Brian Park, 2004 Microscopic traffic simulation models have been widely accepted and applied in transportation engineering and planning practice for the past decades because simulation is cost effective safe and fast To achieve high fidelity and credibility for a traffic simulation model calibration and validation are of utmost importance Most calibration efforts reported in the literature have focused on the informal practice with a specific simulation model but seldom did they propose a systematic procedure or guideline for simulation model calibration and validation The purpose of

this study was to develop and evaluate a procedure for microscopic simulation model calibration and validation Three widely used microscopic traffic simulation models VISSIM PARAMICS and CORSIM were selected for model review and practice of model calibration and validation The validity of the proposed procedure was evaluated and demonstrated via two case studies including an actuated signalized intersection and a 5 mile freeway segment with a lane closure work zone The simulation results were compared against the field data to determine the performance of the calibrated models The proposed procedure yielded acceptable results for all applications thus confirming that it was effective for the different networks and simulation models used in the study Although the calibrated parameters generated the performance measures that were representative of the field conditions the simulation results of the default parameters were significantly different from the field data
