Modeling and Optimal Control of Heavy-Duty Powertrains Vaheed Nezhadali, 2016-05-30 Heavy duty powertrains are complex systems with components from various domains different response times during transient operations and different efficient operating ranges To ensure efficient transient operation of a powertrain e g with low fuel consumption or short transient duration it is important to come up with proper control strategies In this dissertation optimal control theory is used to calculate and analyze efficient heavy duty powertrain controls during transient operations in different applications This is enabled by first developing control ready models usable for multi phase optimal control problem formulations and then using numerical optimal control methods to calculate the optimal transients Optimal control analysis of a wheel loader operating in a repetitive loading cycle is the first studied application Increasing fuel efficiency or reducing the operation time in such repetitive loading cycles sums up to large savings over longer periods of time Load lifting and vehicle traction consume almost all of the power produced by a diesel engine during wheel loader operation Physical models are developed for these subsystems where the dynamics are described by differential equations The model parameters are tuned and fuel consumption estimation is validated against measured values from real wheel loader operation The sensitivity of wheel loader trajectory with respect to constrains such as the angle at which the wheel loader reaches the unloading position is also analyzed A time and fuel optimal trajectory map is calculated for various unloading positions Moreover the importance of simultaneous optimization of wheel loader trajectory and the component transients is shown via a side to side comparison between measured fuel consumption and trajectories versus optimal control results In another application

optimal control is used to calculate efficient gear shift controls for a heavy duty Automatic Transmission system A modeling and optimal control framework is developed for a nine speed automatic transmission Solving optimal control problems using the developed model time and jerk efficient transient for simultaneous disengagement of off going and engagement of incoming shift actuators are obtained and the results are analyzed Optimal controls of a diesel electric powertrain during a gear shift in an Automated Manual Transmission system are calculated and analyzed in another application of optimal control The powertrain model is extended by including driveline backlash angle as an extra state in the system This is enabled by implementation of smoothing techniques in order to describe backlash dynamics as a single continuous function during all gear shift phases Optimal controls are also calculated for a diesel electric powertrain corresponding to a hybrid bus during a tip in maneuver It is shown that for optimal control analysis of complex powertrain systems minimizing only one property such as time pushes the system transients into extreme operating conditions far from what is achievable in real applications Multi objective optimal control problem formulations are suggested in order to obtain a compromise between various objectives when analyzing such complex powertrain systems *Aggman* ,2002 **Better Roads** ,2000 *Business America* ,1980 Includes articles on international business opportunities [American Recycler January 2009](#) , **Forest Industries** ,1984 *Loggers' Handbook* ,1975 *California Builder & Engineer* ,2002 *Official Gazette of the United States Patent and Trademark Office* ,2004 **Intelligent Control for Agricultural Applications 2001** H.K. Purwadaria,2002-05-14 This Proceedings contains the papers presented at the second IFAC CIGR Workshop on Intelligent Control For Agricultural Applications held in Bali Indonesia 22 24 August 2001 The workshop provided a forum for the presentation and discussion of new results and approaches in the area of intelligent control application in agriculture and industry The topics covered in the Proceedings range from precision farming to applications of control neural networks and fuzzy algorithms in greenhouse technology agricultural production and industrial processes Also covered are quality evaluation using non destructive methods such as ultrasonic visible light and near infrared reflectance NIR as well as agricultural commodities including fishery products as well as plants Altogether over 50 papers are presented including keynote papers by leading world experts **Wheel Loader 988** , **Michigan Roads and Pavements** ,2000-05 *Agricultural Compendium* Euroconsult (Organization),1989-04 Like its predecessors this third revised edition of the *Agricultural Compendium* is packed with a wealth of statistical and general information about almost every aspect of agriculture in the tropics and subtropics Anyone in tropical rural development whether in a technical capacity or as an economist planner making use of technical results would both save themselves time and increase their understanding and efficiency through possession of this compendium It is not only a reference volume but potentially a major contribution to mutual understanding and therefore communication between different disciplines commented Soil Survey and Land Evaluation after the publication of an earlier edition Numerous sections e g Chapter 7 Part B Fisheries and even complete

chapters e g Chapter 3 Geodasy Chapter 10 Sociology have been rewritten for the present edition A number of new sections have also been added e g in Chapter 3 a section on remote sensing techniques Furthermore in view of the now common use of scientific pocket calculators and personal computers a number of graphs have been replaced by the original formulae
