

NAME

intro - introduction to system calls

DESCRIPTION

Section 2 of the manual describes the Linux system calls. A system call is an entry point into the Linux kernel. Usually, system calls are not invoked directly: instead, most system calls have corresponding C library wrapper functions which perform the steps required (e.g., trapping to kernel mode) in order to invoke the system call. Thus, making a system call looks the same as invoking a normal library function.

In many cases, the C library wrapper function does nothing more than:

- * copying arguments and the unique system call number to the registers where the kernel expects them;
- * trapping to kernel mode, at which point the kernel does the real work of the system call;
- * setting errno if the system call returns an error number when the kernel returns the CPU to user mode.

However, in a few cases, a wrapper function may do rather more than this, for example, performing some preprocessing of the arguments before trapping to kernel mode, or postprocessing of values returned by the system call. Where this is the case, the manual pages in Section 2 generally try to note the details of both the (usually GNU) C library API interface and the raw system call. Most commonly, the main DESCRIPTION will focus on the C library interface, and differences for the system call are covered in the NOTES section.

For a list of the Linux system calls, see `syscalls(2)`.

Extreme-Scale Computing Raymond J. Spiteri, Kyle Klenk, 2025-09-02

Scientific computing is essential for tackling complex problems across many domains but how can scientists develop high performance and high quality software that scales efficiently This book serves as an accessible introduction to extreme scale computing specifically designed for domain scientists who may not have formal computer science training but need to harness the power of C and parallel computing for large scale applications The book begins by covering the fundamentals of scientific computing software management including essential tools like Linux Git and CMake before diving into a detailed exploration of C for extreme scale computing Readers familiar with languages like Python will gain the necessary skills to transition to C and build scalable efficient software Beyond basic programming this book delves into hardware aware computing teaching readers how to optimize software performance by understanding the underlying architecture of modern computational systems It then introduces parallel computing techniques covering MPI for distributed memory parallelism shared memory parallelism CUDA for GPU programming and Kokkos for performance portability Further chapters focus on efficient I O debugging and profiling which all address aspects of the critical challenge of performance optimization in extreme scale computing The book concludes with an overview of popular libraries for extreme scale computing equipping readers with the tools they need to solve real world computational problems With a balance of theory practical applications and illustrative case studies this book provides domain scientists with a comprehensive roadmap to mastering extreme scale computing and developing highly parallel and performant software
