

DOSAGE CALCULATION

METHODS FOR DRUG DOSAGE CALCULATIONS

Various methods are used for solving medication calculation, the most common methods are :

- **Desired Over Have or Formula Method**
- **Dimensional Analysis Method**
- **Ratio and Proportion Method**

Formula Method

$$\frac{\text{DESIRED (D)}}{\text{HAVE (H)}} \times \text{QUANTITY (Q)} = Y \text{ (amount to administer)}$$

Symbol	Meaning	Example
D	Dosage ordered or desired dose	<ul style="list-style-type: none"> • Give 1.2 milliliters • The doctor orders 90 milligrams
H	Dose on hand or dose, on the label of bottle, vial, ampule.	<ul style="list-style-type: none"> • 250 milligrams • 100 mg 
Q	The unit of measure for the specific dosage strength or supply on hand (the form in which the drug comes)	<ul style="list-style-type: none"> • per tablet • per capsule • in 2 mL
Y	The dosage you are trying to calculate	

Example 1: Ampicillin 1.5 g, is ordered. Ampicillin is available as 500 mg per capsules. How many tablets would the nurse administer?

- Desired (D) = 1.5 g = 1500 mg
- On hand (H) = 500 mg
- Quantity (Q) = 1 capsule

$$\frac{1500 \text{ mg}}{500 \text{ mg}} \times 1 \text{ (Capsule)} = 3 \text{ capsules}$$

Make sure that these units match up 

The nurse would administer 3 capsules

Example 2:

- Order: Acetaminophen 500 mg
- On hand: Acetaminophen 250 mg in 5 mL

- Desired (D) = 500 mg
- On hand (H) = 250 mg
- Quantity (Q) = 5 mL

$$\frac{500 \text{ mg}}{250 \text{ mg}} \times 5 \text{ mL} = 10 \text{ mL}$$

Make sure that these units match up 

The nurse would administer 10 mL of Acetaminophen

Treatment Planning of High Dose-Rate Brachytherapy - Mathematical Modelling and Optimization Björn Morén, 2021-01-12 Cancer is a widespread class of diseases that each year affects millions of people It is mostly treated with chemotherapy surgery radiation therapy or combinations thereof High dose rate HDR brachytherapy BT is one modality of radiation therapy which is used to treat for example prostate cancer and

gynecologic cancer In BT catheters i e hollow needles or applicators are used to place a single small but highly radioactive source of ionizing radiation close to or within a tumour at dwell positions An emerging technique for HDR BT treatment is intensity modulated brachytherapy IMBT in which static or dynamic shields are used to further shape the dose distribution by hindering the radiation in certain directions The topic of this thesis is the application of mathematical optimization to model and solve the treatment planning problem The treatment planning includes decisions on catheter placement that is how many catheters to use and where to place them as well as decisions for dwell times Our focus is on the latter decisions The primary treatment goals are to give the tumour a sufficiently high radiation dose while limiting the dose to the surrounding healthy organs to avoid severe side effects Because these aims are typically in conflict optimization models of the treatment planning problem are inherently multiobjective Compared to manual treatment planning there are several advantages of using mathematical optimization for treatment planning First the optimization of treatment plans requires less time compared to the time consuming manual planning Secondly treatment plan quality can be improved by using optimization models and algorithms Finally with the use of sophisticated optimization models and algorithms the requirements of experience and skill level for the planners are lower The use of optimization for treatment planning of IMBT is especially important because the degrees of freedom are too many for manual planning The contributions of this thesis include the study of properties of treatment planning models suggestions for extensions and improvements of proposed models and the development of new optimization models that take clinically relevant but uncustomary aspects into account in the treatment planning A common theme is the modelling of constraints on dosimetric indices each of which is a restriction on the portion of a volume that receives at least a specified dose or on the lowest dose that is received by a portion of a volume Modelling dosimetric indices explicitly yields mixed integer programs which are computationally demanding to solve We have therefore investigated approximations of dosimetric indices for example using smooth non linear functions or convex functions Contributions of this thesis are also a literature review of proposed treatment planning models for HDR BT including mathematical analyses and comparisons of models and a study of treatment planning for IMBT which shows how robust optimization can be used to mitigate the risks from rotational errors in the shield placement Cancer r en grupp av sjukdomar som varje r drabbar miljontals m nniskor De vanligaste behandlingsformerna r cellgifter kirurgi str lbehandling eller en kombination av dessa I denna avhandling studeras h gdosrat brachyterapi HDR BT vilket r en form av str lbehandling som till exempel anv nds vid behandling av prostatacancer och gynekologisk cancer Vid brachyterapibehandling anv nds ih liganlar eller applikatorer f r att placera en millimeterstor str lk lla antingen inuti eller intill en tum r I varje n l finns det ett antal s kallade dr jpositioner d r str lk llan kan stanna en viss tid f r att bestr la den omkringliggande v vna den i alla riktningar Genom att v lja l mpliga tider f r dr jpositionerna kan dosf rdelningen formas efter patientens anatomi Ut ver HDR BT studeras ocks den nya tekniken intensitetsmodulerad brachyterapi IMBT vilket r en variation p HDR BT d r sk rmming anv

nds för att minska strålningen i vissa riktningar vilket gör det möjligt att forma dosfördelningen bättre. Planeringen av en behandling med HDR-BT omfattar hur många nallar som ska användas var de ska placeras samt hur länge strålkanallerna ska stanna i de olika drjpositionerna. För HDR-BT kan dessa vara flera hundra stycken medan det för IMBT snarare handlar om tusentals möjliga kombinationer av drjpositioner och inställningar av skärmarna. Planeringen resulterar i en dosplan som beskriver hur hög stråldos som tumören och intilliggande frisk vävnad och riskorgan utsätts för. Dosplaneringen kan formuleras som ett matematiskt optimeringsproblem vilket är mnet för avhandlingen. De verktygen för behandlingen är att ge en tillräckligt hög stråldos till tumören för att döda alla cancerceller samt att undvika att bestålla riskorgan eftersom det kan ge allvarliga biverkningar. Då alla inställningarna inte samtidigt kan uppnås fullt ut så är optimeringsproblemet för flera inställningar behövt prioriteras mot varandra. Utöver att dosplanen uppfyller kliniska behandlingsriktlinjer så är också tidsaspekten av planeringen viktig eftersom det är vanligt att den går medan patienten är bedövad eller sövd. Vid utvärdering av en dosplan används dosvolymmetri. För en tumör anger ett dosvolymmetri hur stor andel av tumören som får en stråldos som är högre än en specificerad nivå. Dosvolymmetri utgör en viktig del av målen för dosplaner som tas upp i kliniska behandlingsriktlinjer och ett exempel på ett sådant mål vid behandling av prostatacancer är att 95% av prostatans volym ska få en stråldos som är minst den för reskrivna dosen. Dosvolymmetri utläses ur de kliniskt betydelsefulla dosvolymhistogrammen som för varje stråldosnivå anger motsvarande volym som erhåller den dosen. En fördel med att använda matematisk optimering för dosplanering är att det kan spara tid jämfört med manuell planering. Med väl utvecklade modeller så finns det också möjlighet att skapa bättre dosplaner till exempel genom att riskorganen nås av en lägre dos men med bibehållen dos till tumören. Vidare så finns det även fördelar med en process som inte är lika personberoende och som inte kräver erfarenhet i lika stor utsträckning som manuell dosplanering i dagsläget gör. Vid IMBT är det dessutom så många frihetsgrader att manuell planering i stort sett blir omöjligt. I avhandlingen ligger fokus på hur dosvolymmetri kan användas och modelleras explicit i optimeringsmodeller så kallade dosvolymmodeller. Detta omfattar såväl analys av egenskaper hos befintliga modeller utvidgningar av tidigare använda modeller samt utveckling av nya optimeringsmodeller. Eftersom dosvolymmodeller modelleras som heltalsproblem vilka är beräkningskrävande att lösa så är det också viktigt att utveckla algoritmer som kan lösa dem tillräckligt snabbt för klinisk användning. Ett annat mål för modellutvecklingen är att kunna ta hänsyn till fler kriterier som är kliniskt relevanta men som inte ingår i dosvolymmodeller. En sådan kategori av mått är hur dosen är fördelad rumsligt exempelvis att volymen av sammanhängande område som får en alldeles för hög dos ska vara liten. Sådana områden går dock inte att undvika helt eftersom det är typiskt för dosplaner för brachyterapi att stråldosen fördelar sig ojämnt med väldigt höga doser till små volymer precis intill strålkanallerna. Vidare studeras hur små fel i inställningarna av skärmningen i IMBT påverkar dosplanens kvalitet och de olika utvärderingsmått som används kliniskt. Robust optimering har använts för att säkerställa att en dosplan tas fram som är robust sett till dessa möjliga fel i hur skärmningen är placerad. Slutligen ges en omfattande översikt över optimeringsmodeller för dosplanering av HDR-BT och speciellt hur
