### Photosynthesis and Energy Transformation

Photosynthesis is a process used by plants to convert light energy into chemical energy that can be stored and used by the plant. This process primarily occurs in the leaves, which absorb carbon dioxide from the air and water from the soil into the xylem, a type of sugar. Oxygen is released as a byproduct during this process.

The inputs of photosynthesis are light energy, carbon dioxide, and water. The outputs are glucose and oxygen. Glucose stores energy in its chemical bonds, which plants can use for growth and repair. The oxygen produced is available for photosynthesis in other parts of the plant and for other organisms that use oxygen to produce energy through cellular respiration.
