The control of stepper motors is not simple, particularly when an specially designed control circuit is used. The Type TEA402 is an integrated stepper motor controller that can cope with most if not all situations. In addition to controlling the phases for whole and half steps, it also sets the current with the aid of three phases.

The TEA402 was specially designed for the control of unipolar stepper motors, to which the current passes through the star windings in one direction. Because the windings

rotate collectively, the current through them will become too large when the stepping speed is low. The reason for this is that in that situation only the three resistance, which is being used, determines the value of the current. To limit the current, a limiting circuit is connected in series with the windings. In the diagram, the current through L_1 and L_2 is restricted to 0.5 A, and that through L_3 and L_4 to 0.25 A. This enables the current through the star windings to be adapted to any type of motor. The table shows in what sequence

the various phases are driven with full and half step control, as well as the clockwise and anticlockwise control. The stepper motor is connected to the system or computer with the STEP input (C1) in the clock input for each pulse, the motor takes one step forward or one step backwards. Because inputs C1, STEP, COUNTER, and DIR all are TTL compatible, it is not difficult to connect these controls to a computer. Reconnect E_1 to E_2 and the associated switches enable the circuit to be manually provided with control
