

PhET Online Lab, Geometric Optics, Part 1

I. Introduction

In this guided inquiry activity lab you will investigate how an image is formed by four different optical instruments: a convex lens, a concave lens, a convex mirror and a concave mirror. By the end of this lab, you should be able to (1) explain how the characteristics of the image change as the object is brought closer to each of the lenses and mirrors, (2) explain the similarities and differences between the image formation for each of the lenses and mirrors and (3) explain the meaning of the points F and $2F$ for the convex lenses and concave mirrors.

You will use one of the simulations from PhET Interactive Simulations. The simulation is called Geometric Optics (HTML5). The link for the simulation is: <https://phet.colorado.edu/en/simulation/geometric-optics>.

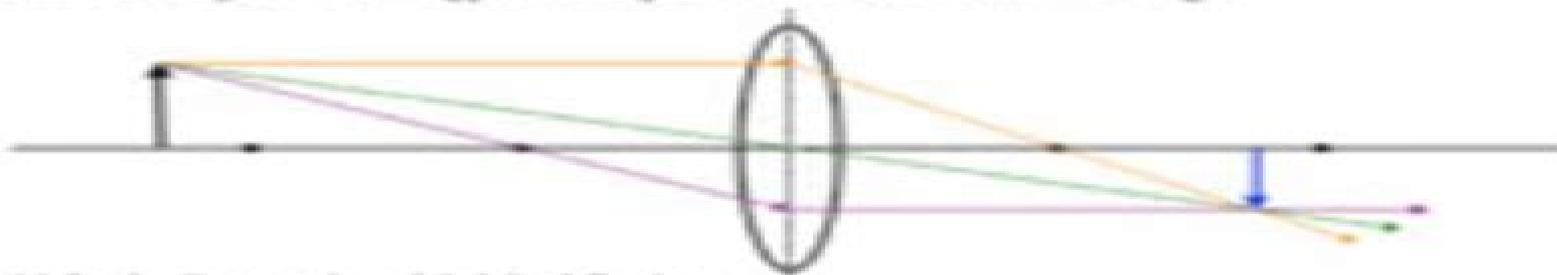

II. Convex Lens and Concave Mirror

To begin, click on the Lens window. Next click on the PhET logo in the bottom right hand corner of the simulation and then click Options. When the Options window opens, check the add "2F points" box and change the focal length control from infinite to direct. Close the Options window.

Next, on the simulation window (1) change Rays from Marginal to Principal, (2) make the lens diameter 200 cm and (3) check the 2F Points and Labels boxes. Leave the focal length at 50 cm and the Second Point box unchecked.

Choose an object from the upper left drop-down menu. Do not choose the light.

(4) On the diagram above label the following:

- | | |
|---------------------|---|
| a) the optical axis | e) the focal lengths |
| b) the object | f) the points that are two focal lengths away from the lens |
| c) the image | g) the object distance |
| d) the focal points | h) the image distance |

(5) Move the object back and forth on the optical axis. Where does the convex lens form an image?

Learning With Escape Rooms in Higher Education Online Environments Santamaría Urbieta, Alexandra, Alcalde Peñalver, Elena, 2023-02-10 Teachers professors and educational professionals have the opportunity to create new challenging significant and interactive learning experiences for today's students. Escape rooms are growing in popularity as they provide numerous benefits and opportunities for learning; however, the use of escape rooms in higher education is not always taken seriously. *Learning With Escape Rooms in Higher Education Online Environments* proves that it is possible to take escape rooms to higher education with great results for both teachers and students by presenting different escape room proposals that are explained in detail with the instructions and materials used so that any teacher could replicate it in their subject. Covering key topics such as online learning, student learning, and computer science, this reference work is ideal for principals, industry professionals, researchers, scholars, practitioners, academicians, instructors, and students. ***Geometric Optics*** Allen Nussbaum, 1968 ***Teaching about Geometric Optics*** Jane Bray Nelson, Jim Nelson, 2020 ***Geometric Optics*** Antonio Romano, Roberto Cavaliere, 2016-09-26 This book, unique in the literature, provides readers with the mathematical background needed to design many of the optical combinations that are used in astronomical telescopes and cameras. The results presented in the work were obtained by using a different approach to third-order aberration theory as well as the extensive use of the software package Mathematica. Replete with workout examples and exercises, *Geometric Optics* is an excellent reference for advanced graduate students, researchers, and practitioners in applied mathematics, engineering, astronomy, and astronomical optics. The work may be used as a supplementary textbook for graduate-level courses in astronomical optics, optical design, optical engineering, programming with Mathematica, or geometric optics. ***Introduction to Geometrical Optics*** Milton Katz, 2002 This book is the culmination of twenty-five years of teaching *Geometrical Optics*. The volume is organized such that the single spherical refracting surface is the basic optical element. Spherical mirrors are treated as special cases of refraction with the same applicable equations. Thin lens equations follow as combinations of spherical refracting surfaces, while the cardinal points of the thick lens make it equivalent to a thin lens. Ultimately, one set of vergence equations are applicable to all these elements. The chapters are devoted to in-depth treatments of stops, pupils, and ports; magnifiers; microscopes; telescopes; and camera lenses; ophthalmic instruments; resolving power and MTF; trigonometric ray tracing; and chromatic and monochromatic aberrations. There are over 100 worked examples, 400 homework problems, and 400 illustrations. First published in 1994 by Penumbra Publishing Co. ***Geometric Optics***, 1987 ***Geometrical Optics and Related Topics*** Ferruccio Colombini, Nicolas Lerner, 1997 This volume contains 14 research papers which cover various topics including blowup questions for quasilinear equations in 2-D, uniqueness results for systems of conservation laws in 1-D, conservation effects for critical nonlinear wave equations, diffraction of nonlinear waves, propagation of singularities in scattering theory, and caustics for semilinear oscillations. Other topics linked to microlocal analysis which are discussed are

Sobolev spaces in Weyl Hormander calculus local solvability for pseudodifferential equations and hypoellipticity for highly degenerate operators A result for the Cauchy problem under partial analyticity assumptions and an article on the regularity of solutions for the characteristic initial boundary value problem are also included Most of the papers contain detailed proofs which are accessible to graduate students and active researchers in connected areas *Geometric Optics* J.
