## Plant Parts and Functions:

Seed-producing plants generally have four basic structures, or parts, that perform certain functions.

- **Roots** anchor the plant and take in water and nutrients from the soil.
- The **stem** provides support and moves water and nutrients throughout the plant.
- **Leaves** carry out photosynthesis and make food for the plant.
- **Flowers** allow the plant to reproduce. They attract pollinators and produce seeds.

## Photosynthesis:

Green plants produce their own food through a chemical process called **photosynthesis**. This process takes place inside the plant's leaves. The leaves contain a pigment called **chlorophyll**. Chlorophyll traps sunlight inside the leaves. Carbon dioxide also enters the leaves through tiny holes called stomata. During photosynthesis, the plant uses the sunlight, carbon dioxide, and water to make its own food (in the form of sugar). The plant also produces oxygen, which it releases as a waste product.

**sunlight + carbon dioxide + water = sugar and oxygen**

Green plants are very different than animals because they are able to use energy from the sun to make their own food. They are called producers, and they are the first step in most food chains.
