Java: A Beginner's Guide, Ninth Edition Herbert Schildt, 2022-01-07 A practical introduction to Java programming

fully revised for the latest version Java SE 17 Thoroughly updated for Java Platform Standard Edition 17 this hands on resource shows step by step how to get started programming in Java from the very first chapter Written by Java guru Herbert Schildt the book starts with the basics such as how to create compile and run a Java program From there you will learn essential Java keywords syntax and commands Java A Beginner s Guide Ninth Edition covers the basics and touches on advanced features including multithreaded programming generics Lambda expressions and Swing Enumeration modules and interface methods are also clearly explained This guide delivers the appropriate mix of theory and practical coding necessary to get you up and running developing Java applications in no time Clearly explains all of the new Java SE 17 features Features self tests exercises and downloadable code samples Written by bestselling author and leading Java authority Herbert Schildt *Proceedings of the 9th Workshop on Aspects, Components, and Patterns for Infrastructure Software (ACP4IS '10)* Bram Adams, Michael Haupt, Daniel Lohmann, 2010 Aspect oriented programming component models and design patterns are modern and actively evolving techniques for improving the modularization of complex software In particular these techniques hold great promise for the development of systems infrastructure software e g application servers middleware virtual machines compilers operating systems and other software that provides general services for higher level applications The developers of infrastructure software are faced with increasing demands from application programmers needing higher level support for application development Meeting these demands requires careful use of software modularization techniques since infrastructural concerns are notoriously hard to modularize Aspects components and patterns provide very different means to deal with infrastructure software but despite their differences they have much in common For instance component models try to free the developer from the need to deal directly with services like security or transactions These are primary examples of crosscutting concerns and modularizing such concerns are the main target of aspect oriented languages Similarly design patterns like Visitor and Interceptor facilitate the clean modularization of otherwise tangled concerns Building on the ACP4IS meetings at AOSD 2002 2009 this workshop aims to provide a highly interactive forum for researchers and developers to discuss the application of and relationships between aspects components and patterns within modern infrastructure software The goal is to put aspects components and patterns into a common reference frame and to build connections between the software engineering and systems communities Legal Protection for Computer-Implemented Inventions Sabine Kruspig, Claudia Schwarz, 2016-04-24 As a result of the incorporation of computer software into countless commercial and industrial products the patentability of software has become a vital issue in intellectual property law This indispensable book provides an overview on the current status of computer implemented inventions in patent law across Europe and major jurisdictions worldwide A hugely practical field research tool with guidance based on case law it examines the major hurdles in each particular country and describes the best practice to be adopted Clearly showing how enforceable software patent applications can be competitively drafted and how a patent portfolio for

computer implemented inventions can be established in several countries without spending money unnecessarily on problematic examination proceedings this book covers such issues and topics as the following claim categories for patent applications sufficient level of abstraction breadth of the claimed invention fundamental terms of computing and terminological traps probability for patents dependent on software application areas and patents in core areas of computing With separate chapters for the key countries Germany the United Kingdom France the United States China Korea Japan India and the European Patent Office the legal situation for computer implemented inventions in each country or region this book includes guidance on prosecution under national law analyses of relevant court decisions practice checklists and an outlook on future developments The authors describe claim formulation based on actual cases and on principles of computer science in order to show what might be or might not be patentable in each jurisdiction With this incomparable resource patent attorneys and patent professionals in companies will get a basis for making decisions about the most appropriate jurisdictions in which to file patent applications This book will also be of great value to computer professionals who are affected by the protection of software or who are actively involved in the protection of software by patent law
