Basic Biology for Born Engineers Guenter Albrecht-Buehler, 2018-10-19 Physics owes much of its success to the application of differential calculus Correspondingly most laws of physics are formulated as differential equations This success has created the prejudice that a science cannot be exact unless it stands firmly on a foundation of calculus This doesn't however work for biology Living things are not as continuous let alone differentiable as most organisms and their parts change or end quite abruptly Biology cannot offer differential equations for say the role of chromosomal telomeres in aging or a link between macrophage polyploidy and cancer The information flow between the limbic system and the frontal cortex is far too erratic to permit differentiation The pheromone secretions that control the social order of ants follow no mathematical laws The topology of the human skeleton is neither a perfect sphere nor an idealized doughnut However all these and countless other biological phenomena decide life and death and are amazingly exact As such instead of even trying to paint living things with the exquisitely resolving brush of differential calculus we may accept that they are actually made up of individual and sizable pixels Hence this book presents a novel view of biology as the unified science of living mosaics which consist of discrete yet interacting tiles which in turn are such mosaics in their own rights
