Watershed Erosion Processes Tongxin Zhu, Xiangzhou Xu, 2021-09-29 This monograph is a fundamental study of watershed erosion and runoff processes It utilizes decades of soil erosion data to take a comprehensive and balanced approach in covering various watershed erosion processes While there are many works on soil erosion and conservation this book fills the gaps in previously published research by focusing more on mass movement gully erosion soil piping tunnel erosion and the spatial interactions of different erosion processes Additionally the book examines erosion processes in

extreme rainfall events something typically absent in short term studies but discussed in detail here as the book draws on 60 years of research and observations including 30 years of the author's own investigations of erosion under a wide range of rainfall conditions The book is divided into 3 parts and is intended for soil erosion researchers and practitioners and postgraduate students studying soil erosion and water conservation Part 1 opens with a comprehensive and critical review of existing literature on soil erosion processes discusses this book's place among existing literature and examines the major erosion processes rainwash gully erosion tunnel erosion and mass movements including their controlling factors and mechanisms Part 2 explores the spatial interactions of these different erosion processes to provide a prerequisite for effective design of comprehensive soil erosion control measures in a watershed Part 3 evaluates the relative significance of these erosion processes in sediment production the effectiveness of comprehensive soil and water conservation programs and the applications of watershed modelling in determining the impact of land use changes on soil erosion and other ecological processes

pointed argument that cities not nation states can and must take the lead in fighting climate change Climate change is the most urgent challenge we face in an interdependent world where independent nations have grown increasingly unable to cooperate effectively on sustainability In this book renowned political theorist Benjamin R Barber describes how cities by assuming important aspects of sovereignty can take the lead from faltering nation states in fighting climate change Barber argues that with more than half the world's population now in urban areas where 80 percent of both GDP and greenhouse gas emissions are generated cities are the key to the future of democracy and sustainability In this compelling sequel to *If Mayors Ruled the World* Barber assesses both broad principles of urban rights and specific strategies of sustainability such as fracking bans walkable cities above ground mining of precious resources energy and heating drawn from garbage incineration downtown wind turbines and skyscrapers built from wood He shows how cities working together on climate change despite their differences in wealth development and culture can find common measures by which to evaluate the radically different policies they pursue This is a book for a world in which bold cities are collaborating to combat climate change and inspire hope for democracy even as reactionary populists take over national governments in the United States and Europe It calls for a new social contract among citizens and municipalities to secure not only their sustainability but their survival
