

QUESTION 10000: The nurse is caring for a patient with a urinary tract infection (UTI). The patient reports a burning sensation when urinating. Which intervention is most appropriate for the nurse to implement?

Correct Answer:

Encourage the patient to drink plenty of fluids to help flush the bacteria from the urinary tract.

Rationale: Drinking plenty of fluids, such as water, helps dilute the urine and flush the urinary tract, which can help relieve the burning sensation associated with a UTI.

Incorrect Answers:

Administer pain medication as prescribed to relieve the burning sensation. (This is not the most appropriate intervention for a UTI.)

Encourage the patient to void every 2-3 hours to prevent urine from stagnating in the bladder. (This is a good practice for general urinary health but not specifically for relieving the burning sensation of a UTI.)

Incorrect Answer:

Administer antibiotics as prescribed to treat the infection. (This is the most appropriate intervention for a UTI, but the question asks for the most appropriate intervention to relieve the burning sensation.)

Encourage the patient to take a warm sitz bath to help relieve the burning sensation. (This is not a recommended intervention for a UTI.)
