tekniskt kan först ra Internet för att diskutera dessa aspekter Slutsatserna här mynnar ut i att Internets explicita bottom up och problemsuppdelnings design gör det möjligt svårt för någon att medvetet påverka Internet för att ändra dess beskaffenhet och dessutom visar jag att även om man praktiskt lyckas ta över de formellt beslutande som exempelvis ICANNs och IETFs styrelser så finns det inga formella eller praktiska hinder för att bara ignorera dem dvs switching costs för just ICANN eller IETF räkna om tekniskt omständligt med att konfigurera om rutter och routing tabeller och betydligt enklare än att gå från IPv4 till IPv6 då utrustning kan behövas ersättas och därmed en betydligt högre switching cost Med andra ord det är enklare att byta ut Internets koordinerare än att byta ut Internet mot något som fungerar annorlunda Däremot är den rådande politiska världsordningen ett hot mot Internet eftersom den regelstyrda och koordinerade världsordningen inte längre är lika självklar som den varit tidigare Den tredje och sista studien fokuserar på neutralitet dvs rätten till neutralitet har att fånga värden i andra dimensioner än trafikmängd som en praktiskt effekt av hur Internet styrs och fungerar Det primära praktiska bidraget är att neutralitet inte för ses som enbart en reglerings och lagstiftning fråga utan det är mer relevant att prata om i termer av neutralitet i praktiken I den bemärkelsen är lagstiftningens vara eller inte vara mindre intressant än praktisk neutralitets vara eller inte vara och en tyngdpunktsförskjutning i den offentliga debatten hade varit diskussionen om hur Internet fungerar Sammanfattningsvis gäller Internets designprinciper att marknadskrafter och ej direkt reglering ska möjliggöra neutralitet För att förtydliga tanken är att det ska finnas konkurrens inom de flesta nivåer eller lager och att det är av vikt att det finns konkurrens rakt igenom så att en kundvilja för paketneutralitet på tjänstenivå även påverkar nätgar och infrastrukturnivå så att det är användarnas efterfrågan som leder till neutralitet om den användarviljan finns Dock kan det mycket väl vara så att man som användare inte är intresserad av neutralitet och då ska tjänsteleverantörer nätgar och infrastrukturoperatörer inte heller tvingas vara neutrala genom lagstiftning då det går stick i stäv med designprinciperna Inte heller ska en grups vilja kring neutralitet påverka andras möjligheter att vilja Genomgående identifierar jag två kolliderande världsbilder den distribuerade regelstyrda och koordinerade ordningen i sitt perspektiv med sina förhållningar och den mer integrerade och suverena världsordningen med sitt perspektiv och sina förhållningar Rent praktiskt uppfyller Internet en viktig funktion i den tidigare men ej i den senare värld Internet designmässigt är byggt för att tillåta snarare än kontrollera och bestämma Exempelvis finns det inte inbyggda tekniska mekanismer i Internet för att till exempel möjliggöra statlig vervakning eller kontroll av material som finns tillgängligt och då ligger det mer i statens intresse att ha kontrollerade telekommunikationstjänster som kabel TV mobiltelefoni och liknande lösningar där man inte helt enkelt kan lägga på ett extra lager för att uppnå kryptering anonymitet eller tillgång till andra tjänster I texten använder jag perspektiven tillsammans med teknologi marknader och byråkrati för att fånga upp dynamiken och strömningarna i Internet ekologin och jämför med tekniska samhällsordningar som exempelvis järnvägsnät postverk och finansiella marknader Jag konstaterar att Internet har varit styrt av teknologiskt baserade värderingar till skillnad från de andra exemplen som i huvudsak har utformats av dynamiken mellan byråkrati och marknad I

denna m n f rel r jag att teknologi kan anv ndas som str mning och motperspektiv till den klassiska uppst llingen med byr krati och marknad f r att beskriva fenomen i digitaliseringens tids lder Avhandlingen s tter ven p g ende trender i ett bredare perspektiv mot b de organisation och teknik och trycker p vikten av att f rst delarna var f r sig och tillsammans f r att p ett rikare s tt m la upp helheten The modern society is to a large extent Internet dependent Today we rely on the Internet to handle communication for smart doors self scanning convenience stores connected cars production robots telephones and ERP systems The purpose of this thesis is to unbundle the Internet its technology its coordination and practical and theoretical consequences Earlier research has in telecommunications focused on the Internet as one of many potential telecommunications services such as cellphones or cable TV and the management and information systems field has by and large treated the Internet as black boxable infrastructure This thesis explains the Internet from the combined perspectives of technology and coordination This text contains three empirical studies The first is focused on conceptualizing and discussing the Internet in a meaningful way using both technology and coordination frameworks I unceremoniously conclude that the Internet is both a technological and a coordination phenomenon and neither of these aspects can be ignored The Internet is technological in that it concerns digital packet switched digital communication as opposed to circuit switched or purely analog communications The technological dimension of the Internet is similar in its constituency to classical telecommunications networks and has best effort mechanisms for packet delivery In the other dimension coordination the Internet is an explicit bottom up phenomenon minimally coordinated or governed by other ideals than classical telecommunications networks and systems At its core this least necessary coordination concerns technical unique identifiers necessary for inter network communication in practice today manifested as naming with the DNS protocol suite and numbering with the BGP protocol suite Both dimensions follow similar design characteristics the design of the technical Internet is similar to the design of the coordination of the Internet These design principles which are well aligned with software design principles is the cause of the Internet s layered design separation of concerns in practice and minimal view of coordination the least coordinated Internet In general terms it is fruitful to view the Internet and involved actors as an ecology rather than one organization or entity in need of governance or control The second study looks at the social resilience of the Internet That is is it possible through social means to change what the Internet is or can be viewed as I use social resilience as a counterpart to technical resilience i e resilience to technical interference In essence the bottom up and separations of concerns design of the coordination aspect of the Internet minimizes possible influence of actors intent on mission disruption I also practically show that even a take over of the central councils have little effect the constituency of the Internet since these councils are not invested with formal powers of enforcement This thesis suggests that the cost of switching from ICANN and IETF to another set of organizations is quite low due to the nature of the coordination of the Internet compared to for example switching all equipment to IPv6 capable equipment However the current political situation

is a threat to the current Internet regime since an international and rule based world order is no longer on all states agendas The final empirical study focus on the practical and theoretical implications of the Internet on the case of net neutrality The primary contribution is that de facto and de jure net neutrality differ in practice and as such de facto net neutrality deserves more attention Also I suggest that any regulation either for or against net neutrality is problematic since such regulation would interfere with the inherent coordination mechanisms of the Internet As such regulation should focus on providing the necessary markets for Internet function given the coordination and design of the Internet As a net neutrality example net neutral Internet access options should exist as part of a natural service offering if wanted by customers not due to direct regulation Throughout the thesis I identify two colliding world orders both in terms of digital communication networks and terms of organizing society in general the rule based and coordinating order with its champions and the integrated or sovereign order with its champions In practical terms the Internet can be considered a want in the former the distributed perspective but not the later the integrative perspective since the Internet lacks inherent technical controls for surveillance and content control which are necessary in a world order where borders are important Regardless of if that importance stems from state oversight or intellectual property rights legislation I use these perspectives together with technology markets and bureaucracy to catch the dynamics of the Internet ecology I then compare these dynamics with other technological and societal phenomena such as railway networks postal services and financial markets And conclude that the Internet as conceptualized in this thesis can best be explained by technological values in opposite to the other examples which can best be explained by the dynamics of markets and bureaucracies without any real influence of the values of technology As such I suggest that the classical frame of markets and bureaucracy can fruitfully be expanded with technology to better explain the Internet and similar digitization phenomena This thesis puts current trends in a broader perspective based on technology and organization where the two perspectives together better can draw the full picture in a rich fashion
