

Problem 10 (Lecture 10): Chapter 10

Consider the  $3 \times 3$  matrix  $A = \begin{pmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{pmatrix}$ . This matrix clearly exhibits some interesting properties. In this problem, show that  $\det(A) = 0$ . Use the following information as desired:  $\det(A) = \det(A^T)$ ,  $\det(A) = \det(A + \lambda I)$ ,  $\det(A) = \det(A - \lambda I)$ , and  $\det(A) = \det(A^T)$ .

(a) Find a general expression for the cofactor matrix  $C_{ij}$ ,  $C_{ji}$ , and  $C_{ii}$ .

(b) Proceeding as above, show that  $\det(A) = 0$ , where  $A$  is the  $3 \times 3$  matrix  $A = \begin{pmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{pmatrix}$ .

For this problem, you should use the cofactor matrix  $C_{ij}$ ,  $C_{ji}$ ,  $C_{ii}$ , and  $C_{jj}$ . Show that:

$$C_{ij} = \begin{cases} \det(A_{ij}) & \text{if } i \neq j \\ \det(A_{ii}) & \text{if } i = j \end{cases}$$

$$C_{ji} = \begin{cases} \det(A_{ji}) & \text{if } i \neq j \\ \det(A_{jj}) & \text{if } i = j \end{cases}$$

$$C_{ii} = \det(A_{ii})$$

$$C_{jj} = \det(A_{jj})$$

where  $A_{ij}$  is the  $(i, j)$ -minor of  $A$ ,  $A_{ji}$  is the  $(j, i)$ -minor of  $A$ ,  $A_{ii}$  is the  $(i, i)$ -minor of  $A$ , and  $A_{jj}$  is the  $(j, j)$ -minor of  $A$ .

*Observers in Control Systems* George Ellis, 2002-10-16 Observers are digital algorithms that combine sensor outputs with knowledge of the system to provide results superior to traditional structures which rely wholly on sensors Observers have been used in selected industries for years but most books explain them with complex mathematics Observers in Control Systems uses intuitive discussion software experiments and supporting analysis to explain the advantages and disadvantages of observers If you are working in controls and want to improve your control systems observers could be the technology you need and this book will give you a clear thorough explanation of how they work and how to use them Control systems and devices have become the most essential part of nearly all mechanical systems machines devices and manufacturing systems throughout the world Increasingly the efficiency of production the reliability of output and increased energy savings are a direct result of the quality and deployment of the control system A modern and essential tool within the engineer's kit is the Observer which helps improve the performance and reduce the cost of these systems George Ellis is the author of the highly successful Control System Design Guide Second Edition Unlike most controls books which are written by control theorists and academics Ellis is a leading engineer designer author and lecturer working in industry directly with the users of industrial motion control systems Observers in Control Systems is written for all professional engineers and is designed to be utilized without an in depth background in control theory This is a real world book which will demonstrate how observers work and how they can improve your control system It also shows how observers operate when conditions are not ideal and teaches the reader how to quickly tune an observer in a working system Software Available online A free updated and enhanced version of the author's popular Visual ModelQ allows the reader to practice the concepts with Visual ModelQ models on a PC Based on a virtual laboratory all key topics are demonstrated with more than twenty control system models The models are written in Visual ModelQ and are available on the Internet to every reader with a PC Teaches observers and Kalman filters from an intuitive perspective Explains how to reduce control system susceptibility to noise Shows how to design an adaptive controller based on estimating parameter variation using observers Shows how to improve a control system's ability to reject disturbances Key topics are demonstrated with PC based models of control systems The models are written in both MatLab and ModelQ models are available free of charge

*Foundations of Deterministic and Stochastic Control* Jon H. Davis, 2012-12-06 Control theory has applications to a number of areas in engineering and communication theory This introductory text on the subject is fairly self contained and consists of a wide range of topics that include realization problems linear quadratic optimal control stability theory stochastic modeling and recursive estimation algorithms in communications and control and distributed system modeling In the early chapters methods based on Wiener Hopf integral equations are utilized The fundamentals of both linear control systems as well as stochastic control are presented in a unique way so that the methods generalize to a useful class of distributed parameter and nonlinear system models The

control of distributed parameter systems systems governed by PDEs is based on the framework of linear quadratic Gaussian optimization problems Additionally the important notion of state space modeling of distributed systems is examined Basic results due to Gohberg and Krein on convolution are given and many results are illustrated with some examples that carry throughout the text The standard linear regulator problem is studied in the continuous and discrete time cases followed by a discussion of dual filtering problems Later chapters treat the stationary regulator and filtering problems using a Wiener Hopf approach This leads to spectral factorization problems and useful iterative algorithms that follow naturally from the methods employed The interplay between time and frequency domain approaches is emphasized Foundations of Deterministic and Stochastic Control is geared primarily towards advanced mathematics and engineering students in various disciplines
