

EXERCISE 1: DATA INTERPRETATION

Dissolved oxygen is oxygen that is trapped in a fluid. Since many living organisms require oxygen to survive, it is a necessary component of water systems (streams, lakes, rivers, etc.). Dissolved oxygen is measured in units of parts per million (ppm). Examine the data in Table 4, which shows the amount of dissolved oxygen present in a body of water and the number of fish observed in the sample. Then, answer the questions below.

Table 4: Water Quality vs. Fish Population

Dissolved Oxygen (ppm)	0	2	4	6	8	10	12	14	16	18
Number of Fish Observed	0	1	3	10	12	13	15	10	12	13

1. What patterns do you observe based on the information in Table 4?

The main pattern I see is that when one rises so does the other making a increasing population correlation.

2. Develop a hypothesis relating to the amount of dissolved oxygen measured in the water sample and the number of fish observed in the body of water.

With the more dissolved oxygen in the water it allows allows for the number of fish to increase.

3. What would your experimental approach be to test this hypothesis?

I would start by getting a base as a control of just a normal day and then change the level of dissolved oxygen and note the change of observed fish.

4. What would be the independent and dependent variables?

The independent variable is level of dissolved oxygen and the dependent variable is the observed fish.
