**Fast Hopping Frequency Generation in Digital CMOS** Springer,2012-10-13      **Fast Hopping Frequency Generation in Digital CMOS** Mohammad Farazian, Lawrence E. Larson, Prasad S. Gudem,2012-10-12 Overcoming the agility limitations of conventional frequency synthesizers in multi band OFDM ultra wideband is a key research goal in digital technology This volume outlines a frequency plan that can generate all the required frequencies from a single fixed frequency able to implement center frequencies with no more than two levels of SSB mixing It recognizes the need for future synthesizers to bypass on chip inductors and operate at low voltages to enable the increased integration and efficiency of networked appliances The author examines in depth the architecture of the dividers that generate the necessary frequencies from a single base frequency and are capable of establishing a fractional division ratio Presenting the first CMOS inductorless single PLL 14 band frequency synthesizer for MB OFDMUWB makes this volume a key addition to the literature and with the synthesizer capable of arbitrary band hopping in less than two nanoseconds it operates well within the desired range on a 1.2 volt power supply The author's close analysis of the operation stability and phase noise of injection locked regenerative frequency dividers will provide researchers and technicians with much food for developmental thought

**Fast Hopping High-frequency Carrier Generation in Digital CMOS Technology** Mohammad Farazian,2009 One of the challenges in implementing a frequency synthesizer for Multi band OFDM Ultra Wideband MB OFDM UWB is overcoming the agility limitations of conventional synthesizers The MB OFDM proposal for UWB divides the spectrum from 3.1 GHz to 10.6 GHz into 14 different bands and frequency hops at the rate of 3.2 MHz between them with a specified frequency settling time of only 9.5 nS Design techniques that eliminate the use of on chip inductors and which are compatible with low voltage operation are critical for increasing the level of integration for future implementations An inductor less design methodology may have several advantages over traditional design techniques 1 While the area required to implement an on chip inductor does not scale down in the finer technology nodes inductor less designs benefit from technology scaling 2 On the other hand the quality factor of the on chip inductors may worsen in finer technology nodes which can lead to an increase in the required current consumption to generate a given voltage swing 3 It is more straightforward to port an inductor less design into a new technology node The penalty for an inductor less design methodology is a slightly increase in the current consumption to achieve the necessary gain and voltage swing in the absence of inductors In this work a frequency plan is proposed that can generate all the required frequencies from a single fixed frequency and can implement any center frequency with a maximum of two levels of SSB mixing In order to generate all the required frequencies for the operation of this frequency synthesizer out of a single frequency fractional frequency dividers are needed Therefore a study is performed on the architectures that can obtain a fractional division ratio This study involves an analysis of the operation stability and phase noise of injection locked regenerative frequency dividers In addition the operation stability locking range and phase

noise of two stage ring oscillators which are compact ways to generate quadrature output phases and can be used in injection locked regenerative frequency dividers are analyzed This work presents the first CMOS inductor less single PLL 14 band frequency synthesizer for MB OFDM UWB which is capable to perform any arbitrary band switching specified in less than 2 nS Implemented in a 0.13 μm CMOS process it uses a single 1.2 V supply voltage and dissipates 135 mW The mixing sideband level is better than 31 dBc and the phase noise is better than 110 dBc/Hz at 1 MHz offset

*Quadrature Frequency Generation for Wideband Wireless Applications* Mohammad Elbadry, Ramesh Harjani, 2015-03-10 This book describes design techniques for wideband quadrature LO generation for software defined radio transceivers with frequencies spanning 4GHz to around 80GHz The authors discuss several techniques that can be used to reduce the cost and or power consumption of one of the key component of the RF front end the quadrature local oscillator The discussion includes simple and useful insights into quadrature VCOs along with numerous examples of practical techniques

*Direct Digital Synthesizers* Jouko Vankka, Kari A.I. Halonen, 2013-04-17 A major advantage of a direct digital synthesizer DDS is that its output frequency phase and amplitude can be precisely and rapidly manipulated under digital processor control Other inherent DDS attributes include the ability to tune with extremely fine frequency and phase resolution and to rapidly hop between frequencies These combined characteristics have made the technology popular in military radar and communications systems In fact DDS technology was previously applied almost exclusively to high end and military applications it was costly power hungry difficult to implement and required a discrete high speed D/A converter Due to improved integrated circuit IC technologies they now present a viable alternative to analog based phase locked loop PLL technology for generating agile analog output frequency in consumer synthesizer applications It is easy to include different modulation capabilities in the DDS by using digital signal processing DSP methods because the signal is in digital form By programming the DDS adaptive channel bandwidths modulation formats frequency hopping and data rates are easily achieved The flexibility of the DDS makes it ideal for signal generator for software radio The digital circuits used to implement signal processing functions do not suffer the effects of thermal drift aging and component variations associated with their analog counterparts The implementation of digital functional blocks makes it possible to achieve a high degree of system integration Recent advances in IC fabrication technology particularly CMOS coupled with advanced DSP algorithms and architectures are providing possible single chip DDS solutions to complex communication and signal processing subsystems as modulators demodulators local oscillators programmable clock generators and chirp generators The DDS addresses a variety of applications including cable modems measurement equipments arbitrary waveform generators cellular base stations and wireless local loop base stations

Direct Digital Synthesizers was written to find possible applications for radio communication systems It will have appeal for wireless and wireline communication engineers teachers and students
