Overview of Acids and Bases

Acid-base Acids and Bases

Acids: Donates its proton in these processes (H⁺)
 Base: Donates its lone pair to form a bond (H⁺)

Remember: It's only in water, it only HCl is a free

What does aqueous hydrochloric acid and sodium hydroxide solution?

Acid-base Acids and Bases

Acids are proton donors (the molecule is losing its proton)
 Bases are proton acceptors (the molecule is still losing the proton)

General acid-base reactions of acid-base reactions

It shows the proton donor (the base) participating in the reaction and the proton acceptor (the acid).

It shows the loss of the hydrogen and where the electrons go to the other side.

Remember: **acid always donates protons**

Both Arrhenius and Brønsted-Lowry definitions are from Proton Properties. What if there is no proton involved?

Lewis Acids and Bases

Lewis acids: An electron pair acceptor.
 Lewis base: An electron pair donor.

So in the Lewis theory, acids and bases are described in terms of electron.

What are the acid-base theories commonly in use today?

As a general practice, consider acids as 1 and bases as 2.

Acid Strength

What does it mean "strong acid"?

Generally speaking, the more the acid dissociates into a proton, the stronger it is.

The dissociation of the acid is a reversible reaction that is described by equilibrium constant.

Acid Strength and pKa

The Ka value of weak acids (1) and weak bases (2) are shown below.

It's related to a stronger acid because in the 1 equation.

To simplify the equation, $\text{pH} = -\log[\text{H}^+]$ and $\text{pKa} = -\log K_a$ of the given acid.

$$\text{pH} = -\log[\text{H}^+]$$

$$\text{pKa} = -\log K_a \quad \text{pH} = -\log[\text{H}^+] \quad \text{pOH} = -\log[\text{OH}^-]$$

So, **the stronger the acid, the lower the pKa value**. It's the opposite for Kb.

Below are pKa values of some common functional groups.

What makes the Acid Strong?

The strength of the acid is defined by the stability of the conjugate base for the given acid.

What are the acid dissociation constants? **The stronger the acid, the lower value its dissociation constant.**

What if a weak acid and its conjugate base are given, how do you find the strength of acid?

There are 2 ways to do it: considered when knowing the stability of the conjugate base.

1) The first and the best factor is the **charge** to which the hydrogen is connected. Usually to **more electronegative** and **more electronegative**.

2) When the same acid, always use that charge which is **more electronegative** in the base.

1) When comparing elements in different rows, the more electronegative.

Larger atoms have higher polarizability and results for negative charge better in the charge is spread over.

What are weak acids and their conjugate bases more electronegative than acids.

The sulfur atom is larger and stabilizes the negative charge better.

1) The best factor for determining the acidity is called **inductive**.

Inductive or inductive effect is the transmission of charge through atoms.

More electronegative atoms pull the negative charge and help to stabilize the conjugate base.

So more electronegative, the more electron withdrawing, the stronger the acid.

So when the electronegative atom is the halogen, the stronger the acid.

Resonance Acids

1) The best factor is the **charge** of the atom connected to the hydrogen.

The explains the great difference of pKa values of alcohols, aldehydes, and ketones.

1) which is more electronegative than O, so the more O connected, the stronger the acid.

Therefore, for **alcohols** < **aldehydes** < **ketones**.

The primary acids: **Alcohols**, **Aldehydes**, **Ketones**, defined the increasing the acidity of a compound is always in **order**.

Remember: **the more electronegative**

The Position of Equilibrium for an Acid-Base Reaction

1) In the following reactions, choose the product.

What does these reactions are reversible, so another way of asking the question is:

1) In the equilibrium of the reaction, shifted to the right (products) or to the left (reactants)?

To answer this question, you need to remember that the equilibrium of acids and their reactions is shifted towards the weaker acid and the base.

So, you need to compare the pKa of the acid with acid and to compare with conjugate acid.

The equilibrium will be shifted to the higher pKa (weaker acid) side.

1) In the case the pKa of the conjugate acid is **greater** higher than the acid pKa, so the equilibrium is shifted to the right. Therefore, the right pointing arrow is always longer.

Choosing a Base to Deprotonate a Given Compound

Suppose you need to deprotonate the following compound: $\text{CH}_3\text{COCH}_2\text{CH}_3$

(Deprotonate means remove the acidic proton)

First, find its pKa value: $\text{pKa} = 20$

What are the chemical equations of the conjugate bases with a conjugate base of 1.

The pKa of the conjugate acid must be higher than 20, so consider acid is formed.

Find a conjugate base with pKa value with pKa > 20. Answer are used when pKa > 20.

Choosing an Acid to Protonate a Given Compound

Suppose you need to protonate a given compound: $\text{CH}_3\text{COCH}_2\text{CH}_3$

What is a very reactive base and needs to be quenched before being stopped?

To do this, write the chemical equation of what's with a weak acid.

The pKa of the conjugate acid of what is 16. Therefore, the pKa of acid must be lower than 16, stronger acid means, weaker acid bases.

Therefore, a strong acid is a proton donor (acid) for protonating the what's because its pKa is 16 and is a weaker strength of an acid than base.

Brønsted-Lowry's Equation

The equation shows whether the compound with a given pKa is or the acidic or basic (deprotonated) there is an aqueous solution depending on the pH of that solution.

$$\text{pH} > \text{pKa} \rightarrow \text{aq. base}$$

But please not to forget the of the Brønsted-Lowry's equation.

The pKa of organic compounds are in 1-14. Therefore, it is usually in the acidic and basic range is around pKa = 10, which is the environment of the cell pH 7. So, they will be in an active form. Here.
