Advances in Automotive Control 2001 U. Kiencke, G. L. Gissinger, 2001 This Proceedings contains the papers presented at the Third IFAC Workshop on ADVANCES IN AUTOMOTIVE CONTROL held in Karlsruhe Germany on 28-30 March 2001. As the subject indicates the aim of this workshop was to discuss not only the latest advances related to motor vehicles but also and more generally to exchange ideas between academic partners, car manufacturers and subcontractors. The plenary lectures are of great importance and the thematic sessions in the different sections are the essence of such workshops. However, the discussions between experts in the different fields, the meetings between people from industry, universities and public or private laboratories as well as the resulting exchange of ideas are as important. Research is often criticized for providing merely theoretical results and for the insufficient number of its applications. The motor vehicle industry offers a wide field of applications in which we can validate all techniques, tools and methods. This allows us to be involved in all the areas of fundamental research in all the different possible approaches from fundamental research to technology transfer and to observe the actual effects of our results. The increase in road traffic was a major problem of the last century. It is clear that one of the challenges of the XXIst century will be to improve driving safety and comfort. The sessions in the Proceedings volume are divided as follows: Driveline control, Driveline modelling, Vehicle dynamics I and II, Electronic architecture, Intelligent components, Engine control I and II, Engine modelling, Modelling of combustion and turbo charging, Diagnostics and Subsystems. The quality of the papers and the diversity of their origins clearly show the interest taken in this key sector of our research and industry. *Modelling and Control of an Autonomous Two-Wheeled Vehicle* Alen Turnwald, 2020-11-13. With respect to the future urban mobility, modern electrical bicycles, advanced motorcycles and innovative two-wheeled vehicles are attracting enormous amount of attention. Especially model based control and optimal trajectory planning for such vehicles are important to the research and development of the future. Therefore a reliable and yet usable vehicle model as well as a systematic approach to motion control for two-wheeled vehicles are essential to which this work makes a contribution. Currently available two-wheeled vehicle models are mostly either too complex to be used for a systematic control synthesis or too simple such that the physical behaviour of the vehicle is no more represented. In this thesis a unifying approach to modelling and control for autonomous two-wheeled vehicles is presented. The resulting model is generally valid and physically detailed enough to represent the characteristic dynamical behaviour such as the self stability. At the same time it is suited to a systematic control synthesis. Furthermore the systematic extendability for instance by a rider is demonstrated. The model is validated by simulations and by comparison to well known models from the literature. The

proposed vehicle model is derived in the Lagrangian and Hamiltonian framework and used for model based optimal trajectory planning Furthermore a passivity based trajectory tracking controller is designed based on the resulting port Hamiltonian system using the so called generalised canonical transformations Such a controller is physically interpretable and robust against parameter uncertainties To this end existing approaches of passivity based controller design are extended and adjusted for two wheeled vehicles Finally a prototype two wheeled vehicle is introduced which is used for experimental validation of the model and to demonstrate motion control algorithms for autonomous two wheeled vehicles
