**Embedded Systems Design** Bruno Bouyssounouse, Joseph Sifakis, 2005-02-07 Embedded systems now include a very large proportion of the advanced products designed in the world spanning transport avionics space automotive trains electrical and electronic appliances cameras toys televisions home appliances audio systems and cellular phones process control energy production and distribution factory automation and optimization telecommunications satellites mobile phones and telecom networks and security e commerce smart cards etc The extensive and increasing use of embedded systems and their integration in everyday products marks a significant evolution in information science and technology We expect that within a short timeframe embedded systems will be a part of nearly all equipment designed or manufactured in Europe the USA and Asia There is now a strategic shift in emphasis for embedded systems designers from simply achieving feasibility to achieving optimality Optimal design of embedded systems means targeting a given market segment at the lowest cost and delivery time possible Optimality implies seamless integration with the physical and electronic environment while respecting real world constraints such as hard deadlines reliability availability robustness power consumption and cost In our view optimality can only be achieved through the emergence of embedded systems as a discipline in its own right
