

The engine

The engine is the heart of your car. It is a complex machine built to convert heat from burning gas into the force that turns the road wheels.

The chain of reactions which achieves that objective is set in motion by a spark, which ignites a mixture of petrol vapour and compressed air inside a momentarily sealed cylinder and causes it to burn rapidly. That is why the machine is called an internal combustion engine. As the mixture burns it expands, providing power to drive the car.

To withstand its heavy workload, the engine must be a robust structure. It consists of two basic parts: the lower, heavier section is the cylinder block, a casing for the engine's main moving parts; the detachable upper cover is the cylinder head.

The cylinder head contains valve-controlled passages through which the air and fuel mixture enters the cylin-

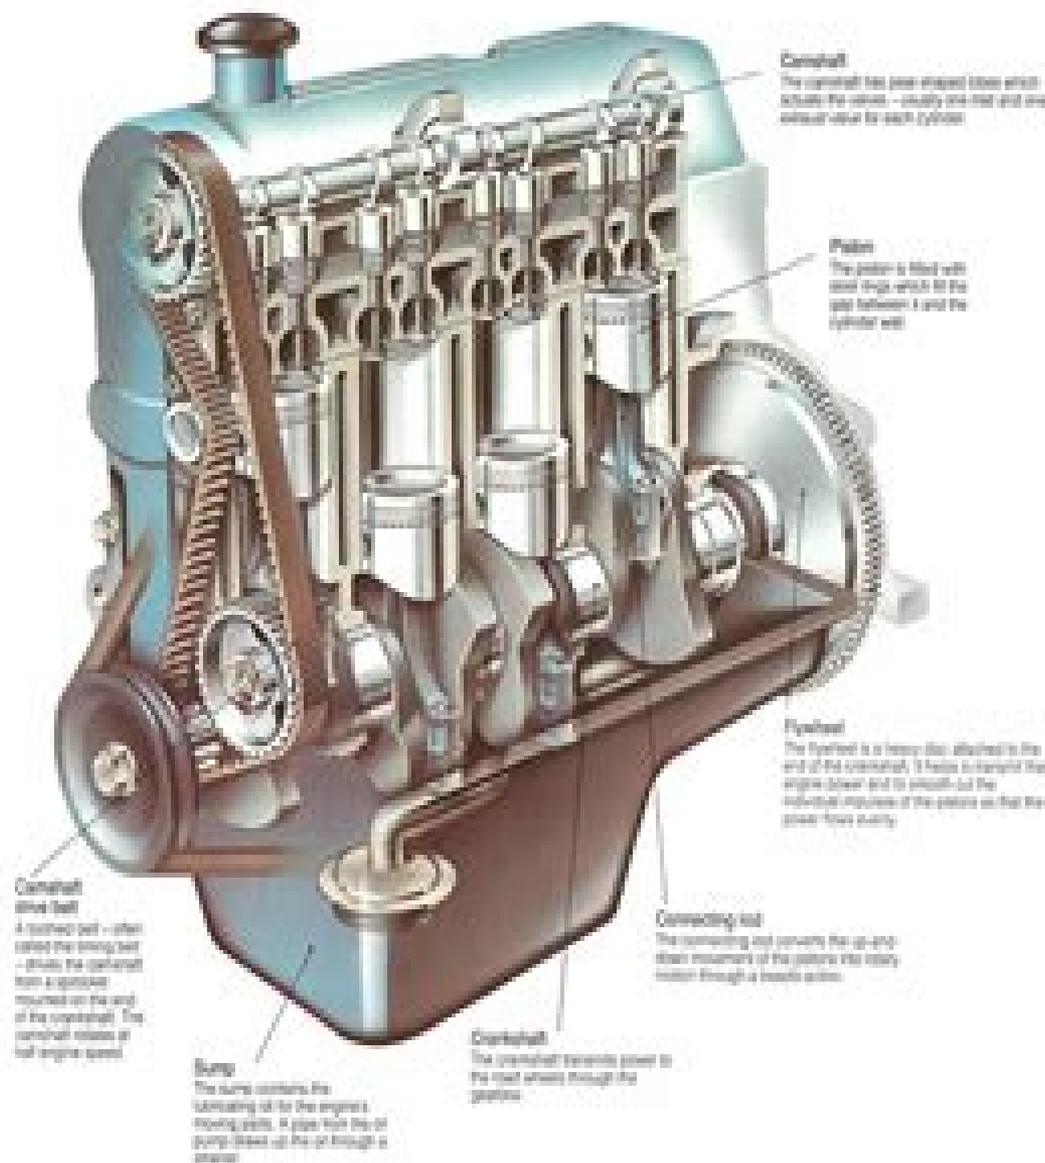

ders, and others through which the gases produced by their combustion are expelled.

The block houses the crankshaft, which converts the reciprocating motion of the pistons into rotary motion at the crankshaft. Often the block also houses the camshaft, which operates mechanisms that open and close the valves in the cylinder head. Sometimes the camshaft is in the head or mounted above it (as illustrated).

The cylinders are cast into the block, so are mountings for auxiliary equipment such as a filter for the oil which lubricates the engine, and a pump for the fuel. An oil reservoir, called the sump, is fitted underneath the crankcase.

Both block and head are usually made of cast iron. But sometimes aluminium is chosen for the head, because it is lighter and dissipates heat more efficiently.

The parts of an overhead-camshaft engine

Camshaft
The camshaft has pear-shaped lobes which operate the valves - usually one for the inlet and one exhaust valve for each cylinder

Piston
The piston is fitted with steel rings which fit the gaps between it and the cylinder wall

Flywheel
The flywheel is a heavy disc attached to the end of the crankshaft. It helps to smooth the engine's power and to smooth out the rotational impulses of the pistons so that the driver feels steady

Connecting rod
The connecting rod converts the up-and-down movement of the pistons into rotary motion through a thrust collar

Crankshaft
The crankshaft transmits power to the road wheels through the gearbox

Sump
The sump contains the lubricating oil for the engine's moving parts. A pipe from the oil pump draws up the oil through a strainer

Camshaft drive belt
A rubbered belt - often called the timing belt - drives the camshaft from a sprocket mounted on the end of the crankshaft. The camshaft opens or falls engine valves

Different engine layouts

The simplest and most common type of engine compresses four vertical cylinders close together in a row. This is known as an in-line engine. Cars with capacities exceeding 2,000cc often have six-cylinder in-line.

The more compact V-engine is found in some cars, especially vehicles with eight or 12 cylinders, and also some with six.

Others have the cylinders arranged opposite each other at an angle of up to 90 degrees.

Some engines have horizontally opposed cylinders. They get an extension of the in-line engine, the angle having been widened to 180 degrees. The advantage lies in saving height and also in certain aspects of balance.

The Future of Post-Human Transportation Peter Baofu,2013-01-03 Can transportation really have such a destructive impact on society that as Jay Holtz

Kay 1998 once forcefully wrote with the automobile industry as an example that the modern consequences of heavy automotive use contribute to the use of non renewable fuels a dramatic increase in the rate of accidental death social isolation the disconnection of community the rise in obesity the generation of air and noise pollution urban sprawl and urban decay WK 2012 This negative expectation from transportation with the automobile industry as an example here can be contrasted with an opposing positive expectation in the old glory days when as Skip McGoun 2012 thus reminded us we have sung songs about the glory and wonder that surrounds the very concept of the car Examples of this range from the 1909 tune In My Merry Oldsmobile to what is considered to be the first rock and roll song Rocket 88 in 1949 Motion pictures have portrayed expensive sleek sports cars associated with wealth and success One commercial described Hell as being a place where a teenager would have to drive a minivan Contrary to these opposing expectations and other views as will be discussed in the book transportation in relation to both networks and operations is neither possible or impossible nor desirable or undesirable to the extent that the respective ideologues on different sides would like us to believe This challenge to the opposing expectations from transportation does not mean that transportation is useless or that those interdisciplinary fields related to transportation studies like urban planning environmental sustainability migration tourism transport economics traffic engineering transportation technology energy efficiency the tragedy of the commons and so on are unimportant Needless to say neither of these extreme views is reasonable Rather this book offers an alternative better way to understand the future of transportation especially in the dialectic context of networks and operations while learning from different approaches in the literature but without favoring any one of them or integrating them since they are not necessarily compatible with each other More specifically this book offers a new theory that is the panoramic theory of transportation to go beyond the existing approaches in a novel way If successful this seminal project is to fundamentally change the way that we think about transportation in relation to networks and operations from the combined perspectives of the mind nature society and culture with enormous implications for the human future and what the author originally called its post human fate
