Your phone is using inverse functions! If your phone is currently in Celsius, it takes just a few quick buttons to switch to Fahrenheit. The following is a function to convert from Celsius (C) to Fahrenheit ($F(C)$)

$$F(C) = \frac{9}{5}C + 32$$

State the domain and range of the function $F(C)$ in words

ANSWER: The domain of the function is the degrees in Celsius. The range of the function is the degrees in Fahrenheit

What's the domain and range of the inverse function, $F^{-1}(C)$?

ANSWER: The domain of the inverse function is the range of the original function. The domain of the inverse function is degrees in Fahrenheit and the range is the degrees in Celsius.

Find the inverse

ANSWER:

$$F(C) = \frac{9}{5}C + 32$$

$$C = \frac{5}{9}F + 32$$

$$C - 32 = \frac{5}{9}F$$

$$\frac{5}{9}(C - 32) = \frac{5}{9} \cdot \frac{9}{5}F$$

$$\frac{5}{9}(C - 32) = F$$

$$F(C) = \frac{5}{9}(C - 32)$$

Approaches to Algebra. N. Bednarz, C. Kieran, L. Lee, 2012-12-06. In Greek geometry, there is an arithmetic of magnitudes in which, in terms of numbers, only integers are involved. This theory of measure is limited to exact measure. Operations on magnitudes cannot be actually numerically calculated except if those magnitudes are exactly measured by a certain unit. The theory of proportions does not have access to such operations. It cannot be seen as an arithmetic of ratios. Even if Euclidean geometry is done in a highly theoretical context, its axioms are essentially semantic. This is contrary to Mahoney's second characteristic. This cannot be said of the theory of proportions, which is less semantic. Only synthetic proofs are considered rigorous in Greek geometry. Arithmetic reasoning is also synthetic, going from the known to the unknown. Finally, analysis is an approach to geometrical problems that has some algebraic characteristics and involves a method for solving problems that is different from the arithmetical approach.

3 GEOMETRIC PROOFS OF ALGEBRAIC RULES

Until the second half of the 19th century, Euclid's *Elements* was considered a model of a mathematical theory. This may be one reason why geometry was used by algebraists as a tool to demonstrate the accuracy of rules, otherwise given as numerical algorithms. It may also be that geometry was one way to represent general reasoning without involving specific magnitudes. To go a bit deeper into this, here are three geometric proofs of algebraic rules: the first by Al-Khwarizmi, the other
