 aided visualization and analysis of fossil specimens through X ray tomography has revolutionized the study of organisms X  
 ray tomography or X ray computed tomography is a characterization technique for generating 3D information from 2  
 dimensional X ray image slices X ray imaging is based on the differential absorption or scattering of an X ray source to reveal  
 internal attributes of biological specimens High resolution tomography can retrieve compositional and structural information  
 of small objects or the macrostructure of larger objects non destructively allowing fossils to be characterized in three  
 dimensions and in unprecedented detail This has enabled paleontologists to gain important insights into the anatomy  
 development and preservation of specimens The resulting digital 3D reconstructions can be used in functional analyses to  
 test hypotheses regarding the paleobiology of extinct organisms that could transform our understanding of long studied fossil  
 groups and the narratives of organismal and ecological evolution Furthermore this proliferation of digital datasets should  
 make the widespread sharing and dissemination of 3D data possible providing access to rare fossil material worldwide
