**Chapter 18 Study**

**Chapter 18: Regulation of Gene Expression**

1. What is meant by the phrase "control of gene expression"?

Control of gene expression is the process where information from a gene synthesizes a protein.

2. What is the value of controlling gene expression for a prokaryote (a bacterial cell)?

They need to manage the number of proteins being produced, so resources are not wasted.

3. What is the value of controlling gene expression for a multi-celled eukaryote?

Multi-celled eukaryotes are able to produce a larger variety of proteins and a larger number of proteins in general.

5. What is a gene's promoter? What role does it serve in regulating transcription?

The promoter is the sequence of DNA where proteins bind to initiate transcription of RNA. The RNA polymerase attaches to the sequence before starting transcription.

**Control of Transcription in Eukaryotes**

14. Briefly outline why control of transcription is more complex in eukaryotes than in prokaryotes.

Control of transcription is more complex in eukaryotes because of compartmentalization, transcription occurs in the nucleus so mRNA has to be transported to the cytoplasm for translation. Chromatin structure also makes it more complex because the DNA is wrapped around histones forming chromatin so the structure must be changed. Eukaryotes have three different RNA polymerases that transcribe different parts of RNA. Eukaryotes also have 5' capping and 3' polyadenylation, and splicing that are absent in prokaryotic mRNAs.
