Interpretation of Fwd Data when Pavement Layers are Not Intact Y. Richard Kim, 1999 When FWD tests are performed on broken or cracked pavements of which information is crucial in making rehabilitation and overlay decisions the multi layered elastic theory based backcalculation programs assume that the effect of these discontinuities in a cracked layer on deflection basins would be accounted for by the reduction of the elastic modulus for that layer However it has been concluded and confirmed by researchers and practitioners that the backcalculation algorithms based on the multi layered elastic theory produce large variation in the algorithms based on the multi layered elastic theory produce large variation in the effective moduli of the cracked layers Studies have also shown that significant errors in the backcalculated pavement moduli can accrue from performing a static analysis of what is inherently a dynamic test Unfortunately dynamic analysis usually involves complex calculations and requires significant computation time thus making it impracticable for routine applications This study presents a methodology based on deflection basin parameters
