each price, we get the quantity supplied for the entire market by multiplying the quantity supplied by the typical firm (from the individual supply curve) by 100. At a price of \$1, each firm produces 40 units, so the market supply is 4000 units (see Panel A). If the price increases to \$2, each firm increases production to 6 units (see Panel B), so the market supply is 600 units (see Panel B).

What happens if there are no identical but instead have different individual supply curves? To compute the market supply in this case, we add the quantities supplied by the hundreds of firms in the market. The assumption that firms are identical is handy because it makes it easier to derive the market supply curve from the supply curve of the typical firm, but it does not change the analysis.

### Market Equilibrium

Figure 4.4 shows a perfectly competitive market in equilibrium. For a market in equilibrium, no conditions are satisfied.

### FIGURE 4.4 Market Equilibrium

Panel A: The typical demand curve represents the demand curve for the supply curve of a typical firm. It shows the price for a quantity of 40. The typical firm's supply curve shows the supply curve of a typical firm. The \$1 price results in a quantity of 40 for the typical firm, or a quantity of 4000 units, and is the market price and quantity.

- 1. At the market level, the quantity of the product supplied equals the quantity demanded. The demand curve represents the demand curve for the supply curve of a typical firm. At a price of \$1 and a quantity of 4000 units per minute (Panel A).
- 2. The typical firm in the market maximizes its profit, given the market price. Given the market price of \$1, each of the 100 firms maximizes profit by producing 40 units per minute (Panel B).
