Genetics Joins Evolutionary Theory

Genetics Joins Evolutionary Theory

Genetics' impact on evolution transformed evolutionary theory.

- 1. Mendel's experiments showed that traits are controlled by genes and that genes segregate independently from one another. This established different alleles in an individual organism, known as heterozygosity, affecting an individual's phenotype.
- 2. Genetic composition varies among related populations. Alleles in a population form a genetic pool of genes, which segregate.
- 3. Allele frequency, is the number of alleles an allele occupies in a gene pool. Genetic drift is the random change in allele frequencies due to the finite gene pool. Genetic drift is less likely to occur in large, though genetic drift is frequent in small populations.

Discovery of Genetic Variation Darwin's view evolved genetic composition over time, genetic composition varied geographically, and local populations.

- 1. Variation in any single trait is composed of DNA.
- 2. Gene frequency differs from one population to another, even during natural selection. The overall effect results in genetic differentiation, which occurs independently of local environmental conditions and is strongly influenced by drift.
- 3. Localized genetic differentiation of genes that also represent quantitative differences, such as the offspring.

Single Gene and Polygenic Traits Mendel's inheritance patterns distinguished two groups: monogenic or Mendelian genes, and polygenic traits.

- 1. Single gene trait is controlled by one gene. An example is single inheritance, such as the inheritance of hair, such as curly hair.
- 2. Polygenic trait is controlled by more than one gene, and the typical allele has several alleles. An example of a polygenic trait is height.

Genetics Joins Evolutionary Theory

The questions 1-4, complete each statement by writing the correct word or phrase.

1. Mendel's experiments made three important discoveries, which show the inheritance.
2. An allele pool contains all alleles present, including the alleles that carry genetic information, present in population.
3. A gene pool typically contains different alleles for each trait in a population.
4. The amount of alleles that constitute a gene, the gene pool, composed both the number of chromosomes and the total number of a species' allele frequency within population.
