

The Great Australian Rabbit Disaster

In the 19th century, settlers from Europe came in droves to this "new wonderful land", Australia. The settlers brought with them many customs from home. One of those customs was rabbit hunting; but unfortunately, Australia did not have any native rabbit species. So in 1859, a European land owner name Thomas Austin imported 24 wild rabbits from England and released them onto his land outside the town of Winchelsea, Victoria. With few rabbit predators and diseases, the rabbits reproduced prolifically. Within only 30 years, the original 24 rabbits had reproduced exponentially to millions and inhabited the states of Victoria, South Wales, and portions of Queensland and South Australia. Large areas of once relatively fertile landscapes were soon transformed into dry areas that became increasingly prone to topsoil loss and drought. In subsequent decades and throughout the majority of the 20th Century, rabbits have migrated to all corners of Australia and now inhabit even the most unlikely areas.

Since the introduction of rabbits to Australia, the surrounding wildlife has been greatly affected including farm livestock populations. It was estimated in 1936 that the extermination of the rabbit population in New South Wales would liberate enough land to accommodate twelve to twenty million more sheep. In addition to effects on livestock, adverse effects were also placed upon other traditional prey species. Soon after the introduction of rabbits, Australian authorities realized they had a problem, so they introduced European foxes into the environment. The authorities thought that since foxes naturally prey on rabbits, they would be the perfect solution to the rabbit problem. However, the foxes seemed to take advantage of their relatively exotic surroundings and turned their attention to easier caught prey including rare ground birds, indigenous marsupials, and rodents. The only remaining semi-natural enemy of the rabbit population in Australia is now the dingo (a free-roaming wild dog). However, in the early 20th Century, dingos were frequently slaughtered due to their aggressive carnivorous habits towards farmers' livestock. Without a traditional predator/prey environment, the rabbits were left to an uninhibited lifestyle.

In the last 150 years, Australia has tried many methods to halt the spreading rabbit population. The legislature even passed laws that, among other things, required landowners to trap, poison or kill rabbits on their property. Because of the enormous numbers of rabbits, every attempt to cut down the rabbit population was doomed to failure. After World War II, Australia declared war on the rabbits and released a deadly virus that was 99.8% effective at killing them. At last Australians thought they had discovered the "magic bullet". However, the 0.2% of the rabbit population that survived was immune to the virus. As the immune rabbits reproduced, they passed on the immunity to their offspring, and the new immune rabbit population ballooned into the millions. It seems that Australians are destined to live with millions of rabbits for quite some time.
