

Heat and Mass Transfer Lab

Experiment 4: The temperature profile and rate of heat transfer for radial conduction through the wall of cylinder

Objective:

To examine the temperature profile and determine the rate of heat transfer resulting from radial conduction through the wall of a cylinder

Procedure:

1. Make sure that the main switch initially off.
2. Connect one of the water tubes to the water supply and the other to drain.
3. Connect the heater supply lead for the radial conduction module into the power supply socket on the control panel.
4. Connect the six sensor (T1, 2, 3 & 4, 5, 6) leads to the radial module, with the T1 connected to the innermost plug on the radial. Connect the remaining five sensor leads to the radial module correspondingly, ending with T6 sensor lead at the edge of the radial module.
5. Turn on the water supply and ensure that water is flowing from the free end of the water pipe to drain. This should be checked at intervals.
6. Turn the heater power control knob control panel to the fully anticlockwise position.
7. Switch on the power supply and main switch: the digital readouts will be illuminated.
8. Turn the heater power control to 40 Watts and allow sufficient time for a steady state condition to be achieved before recording the temperature at all six sensor points and the input power reading on the wattmeter (Q). This procedure can be repeated for other input power between 0 to 40 watts. After each change, sufficient time must be allowed to achieve steady state conditions.
9. Plot of the temperature, T versus distance, r. Calculate the amount of heat transferred.

Results:

Test	Heater Power, Q (Watts)	T1 (°C)	T2 (°C)	T3 (°C)	T4 (°C)	T5 (°C)	T6 (°C)
