The Engineer's Error Coding Handbook A. Houghton,2012-12-06 Error coding is a fascinating subject as much if not more so as it is an indispensable part of modern engineering systems Unfortunately in a bid to remain general and to create a solid foundation upon which to build many books on this subject are out of the reach of those with more engineering based or non mathematical backgrounds This is a pity because in many cases the maths is tractable with few and simple rules If we are content to believe that it works and let others worry about the deeper mysteries of how or why then with a little practice the design and implementation of practical error coding systems becomes straightforward In this text I have attempted to reveal the useful kernel of the subject removing the shell of terms and proofs that usually surrounds it Being somewhat empirical in nature an empiricist and occasionally heard to quote the adage if it works twice it s a law my explanations take this form For many including myself abstract ideas are often better grasped by practical illustration than from yards of theory

Development of a Method for Incorporating Fault Codes in Prognostic Analysis Eric Allen Strong,2014

Information from fault codes associated with a component may be used as an indicator of its health A fault code is defined as a timestamp at which a component is not operating according to recommended guidelines The type of fault codes which are relevant for this analysis represent mild or moderate deviations from normal behavior rather than those requiring immediate repair Potentially fault codes may be used to determine the Remaining Useful Life RUL of a component by predicting its failure time which will improve safety and reduce maintenance costs associated with the component In this dissertation methods have been developed to integrate the degradation information from fault codes into an existing prognostic parameter to improve the estimation of RUL Optimization methods such as gradient descent were used to weight each fault code based on their relevance to degradation Furthermore topic models a document analysis and clustering technique were used as both a dimension reduction method and fault mode isolation Methods developed for this dissertation were applied to two real world data sets an actuator system and monitored signals from a motor accelerated degradation experiment The

best estimation of RUL for the actuator system was a topic model with a mean absolute error of 6.41% of the data received and the best estimation of RUL for the motor accelerated degradation experiment was 5.7% of the average lifetime of the motors. The primary contributions of this research include a method to construct a prognostic parameter from fault codes alone, the integration of degradation information from fault codes into an existing prognostic parameter, the use of topic models in reliability analysis of fault codes, and a software suite that performs these functions on generic data sets.
