

Glyphocrangon sp. nov. (Family Glyphocrangonidae)

Glyphocrangon sp. nov. (Family Glyphocrangonidae)

Glyphocrangon pygmaea (Family Glyphocrangonidae)

These shrimps resemble the parasitic genus *Heterosquilla* in having processes and ridges on the carapace and a first joint of many segments on the second legs. They also have clawed chelate second legs and sub-chelate first legs, unlike almost all other crustaceans.

Infraorder Stenopodidea

This third major group of shrimps contains two families: the Stenopodidae and the Stenopodidae. Stenopodids resemble penaeids in having the second abdominal segment overlapping the first and the third legs clawed, but they differ from penaeids in having the third pair of legs larger than the first and second pairs. In addition, males do not have a petasma, and the eggs are carried under the abdomen of the female. Although there are several genera in the family, only *Stenopus* is commonly seen.

Stenopus hispidus

Banded cleaner shrimp,
banded coral shrimp

Description: The carapace, abdomen and third legs are spiny, and the carpus of the fourth and fifth legs are made up of many segments. These animals grow to a body length of about 80 mm.

Colour: Body and third legs banded in red and white.

Sexes: The male is much smaller than the female.

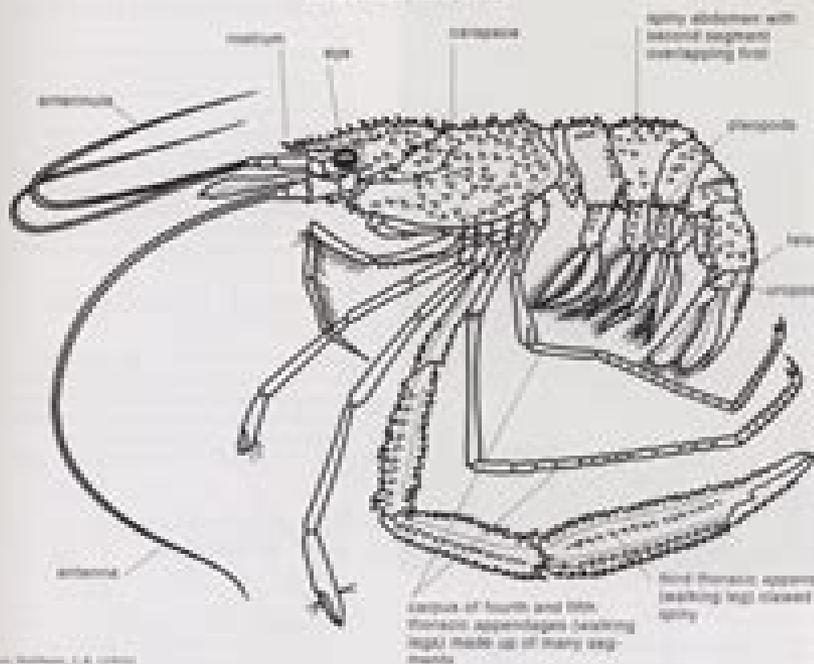

Habitat: Occurring on shallow subtidal coral and rocky reefs, sheltering in crevices and under ledges.

Distribution: Found from Rottnest Island, WA, across northern Australia to southern NSW.
