

STARTING WITH A BOOSTER BATTERY

CAUTION: Never ground off by batteries in tight quarters. Keep sparks and loose wires away from batteries. Be sure polarity is correct before making connections. Ground cable to negative post and starter cable to positive post of battery.

Reversed polarity will damage the electrical system. Always connect positive cable first and then negative cable.

Connections to allow an additional 12-volt battery to be brought into the circuit whenever an auxiliary unit is started. Connect positive cable (A) of battery being connected, negative cable (B).

ELECTRICAL CIRCUIT MALFUNCTIONS

The five possible circuit malfunctions are:

1. High resistance circuit
2. Open circuit
3. Shorted circuit
4. Broken ground

There are only three "tests" of a simple electrical circuit where circuit malfunctions can occur: open circuit, short circuit.

1. Before the connecting switch (S).
2. After the connecting switch but before the lamp (L).
3. After the lamp (L).

1. Open

Circuit malfunctions can easily be confused with circuit malfunctions. Caution must be exercised in diagnosing the cause of the problem.

Example: A component may not operate before an electrical connection is disconnected, but it operates when the connection is reconnected.

Reason: High resistance in the circuit created a voltage drop at the component terminals, preventing the proper amount of current from flowing to the component.
