### Photosynthesis and Energy Transformation

Photosynthesis is a process used by plants to convert light energy into chemical energy that can be stored and used by the plant. This process primarily occurs in the leaves, which absorb carbon dioxide from the air and water from the soil into the xylem. A byproduct of photosynthesis is oxygen, which is released into the atmosphere.

The inputs of photosynthesis are light energy, carbon dioxide, and water. The outputs are glucose and oxygen. Glucose stores energy in its chemical bonds, which plants can use for growth and repair. The oxygen is released into the atmosphere and is used by animals for breathing.

Plants and algae are the primary producers of photosynthesis. They are the only organisms that can produce their own food from inorganic substances and light energy.
