Daniel Downey

In Model A Pathogen:

Manipulation of the cellular microbicidal response and endocytic dynamic by pathogens membrane factors Benjamin Coiffard, Philippe Soubeyran, Eric Ghigo, 2015-07-10 Intracellular pathogens such as bacteria and parasites have evolved specialized mechanisms to survive and replicate in their host leading to disorders and diseases The principle of these mechanisms is to reprogram the microbicidal cell function in order to disable the host cells defence that aims to control and eliminate foreign invaders Devoid of their defence cells become permissive to pathogens invasion The aim of this Research Topic is to highlight and cover recent understanding of mechanisms and molecules used by pathogens to interfere with the microbicidal function of cells This Research Topic will focus on the reprogramming of the cellular dynamics the immune response the phagolysosome biogenesis and the signal transduction pathways by pathogens Special attention will be made on non proteic virulence factors however this Research Topic is not restricted to non proteic virulence factors

Harnessing Useful Rhizosphere Microorganisms for Pathogen and Pest Biocontrol Aurelio Ciancio, Corné M.J. Pieterse, Jesús

Mercado-Blanco, 2017-01-10 Growing demographic trends require sustainable technologies to improve quality and yield of future food productions However there is uncertainty about plant protection strategies in many agro ecosystems Pests diseases and weeds are overwhelmingly controlled by chemicals which pose health risks and cause other undesirable effects Therefore an increasing concern on control measures emerged in recent years Many chemicals became questioned with regard to their sustainability and are or will be banned Alternative management tools are studied relying on biological and low impact solutions This Research Topic concerns microbial biocontrol agents root associated microbiomes and rhizosphere networks Understanding how they interact or respond to a biotic environmental cues is instrumental for an effective and sustainable impact The rhizosphere is in this regard a fundamental object of study because of its role in plant productivity This e book provides a polyhedral perspective on many issues in which beneficial microorganisms are involved Data indeed demonstrate that they represent an as yet poorly explored resource whose exploitation may actively sustain plant protection and crop production Given the huge number of microbial species present on the planet the microorganisms studied represent just the tip of an iceberg Data produced are however informative enough about their genetic and functional biodiversity as well as about the ecosystem services they provide to underpin crop production Challenges for future research work concern not only the biology of these species but also the practices required to protect their biodiversity and to extend their application in the wide range of agricultural soils and systems present in the world Agriculture cannot remain successfully and sustainable unless plant germplasm and useful microbial species are integrated a goal for which new knowledge and information based approaches are urgently needed
