## The Immune System

CHAPTER 1-10

### Chapter 1

#### Elements of the immune system and their roles in defence

##### 1.4 The innate immune response causes inflammation at sites of infection

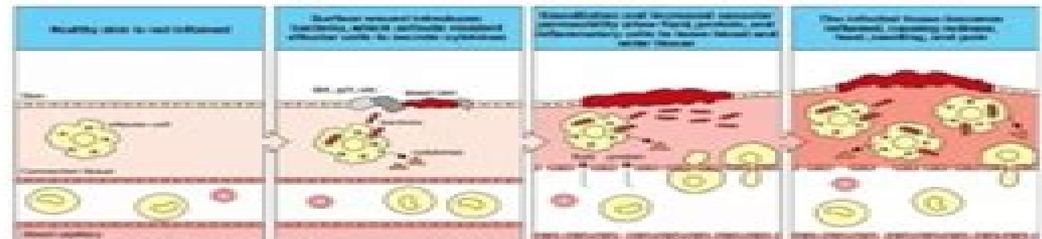

The innate immune response consists of two parts

1. Recognition that a pathogen is present
  - a. Involves soluble proteins and cell-surface receptors that bind either to the pathogen and its products or to human cells and serum proteins that become altered in the presence of the pathogen.
2. The recruitment of destructive *effector mechanisms* that kill and eliminate the pathogen.

Effector mechanisms

- Effector cells
- Complement (serum proteins)

When a pathogen is recognised by cells and proteins, **cytokines** are sent out that interact with other cells to trigger the innate immune response. They induce the local dilation of blood capillaries, that eventually leads to increased blood plasma into the damaged tissue, that contains **inflammatory cells** (WBC).

##### 1.5 the adaptive immune response adds to an ongoing innate immune response

**Lymphocytes** (WBC) are called while the innate response is slowing the spread of the infection. While the effector mechanisms of the adaptive response are similar to those of the innate, the important difference lies in the way in which lymphocytes *recognize* pathogens.
