### Photosynthesis and Energy Transformation

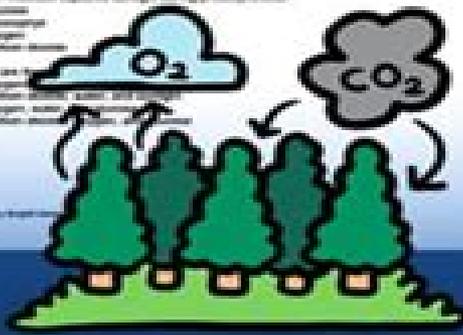

Photosynthesis is a process used by plants to convert light energy into chemical energy that can be stored and used by the plant. This process probably results in the leaves, which absorb light energy. The energy from sunlight is then used to produce carbon dioxide from the air and water from the soil into glucose, a form of sugar. Oxygen is released as a byproduct during this process.

The inputs of photosynthesis are light energy, carbon dioxide, and water. The outputs are glucose and oxygen. Glucose stores energy in its chemical bonds, which plants can use for growth and repair. The general chemical equation for photosynthesis shows the conversion of carbon dioxide and water (producing one molecule of glucose and six molecules of oxygen), using light energy.

Models of photosynthesis include diagrams showing the flow of energy, molecules, and chemical reactions, and chemical equations. Models help us understand how energy from the sun is converted into glucose and how the energy moves through organisms when animals eat plants.
