Q-1. What is Requirement Traceability Matrix?

Answer.

Requirement Traceability Matrix (RTM) is a document which records the mapping between the high-level requirements and the test cases in the form of a table.

That's how it ensures that the Test Plan covers all the requirements and links to their latest version.

Q-2. Explain the difference between Pilot and Beta testing?

Answer. Read the following points to know the difference between Pilot and Beta testing.

1. We do the beta test when the product is about to release to the customer whereas pilot testing takes place in the earlier phase of the development cycle.
2. In the beta test, testing application is given to few users to make sure that application meet the customer requirements and does not contain any showstopper bug. Whereas, in the pilot test, few members of the testing team work at the Customer site to set up the product. They give their feedback also to improve the quality of the end product.

Q-3. Describe how to perform Risk analysis during software testing?

Answer. Risk analysis is the process of identifying the hidden issues that may derail the successful delivery of the application. It also prioritizes the sequence of resolving the identified risks for testing purpose.

Following are some of the risks that are of concern to the QA.

1. New Hardware.
2. New Technology.
3. New Automation Tool.
4. The sequence of code delivery.
5. Availability of test resources for the application.

We prioritize them into three categories which are as follows.

1. High magnitude: Impact of the bug on the other functionality of the application.
2. Medium: it is tolerable in the application but not desirable.
3. Low: it is tolerable. This type of risk has no impact on the company business.
