

How to eliminate air from the fuel system

Warning! If your skin comes into contact with high-pressure fuel, obtain medical assistance immediately.

If air enters the fuel system, it must be removed before the engine can be started.

Air can enter the system if:

- The fuel tank is drained during normal operation
- The low-pressure fuel pipes are disconnected
- A part of the low-pressure fuel system leaks during engine operation.

In order to eliminate air from the fuel system, proceed as follows: Vent screws are not fitted to the fuel injection pump. Air will usually be removed from the fuel pump automatically.

Caution: If the fuel system is empty or if the canister(s) of the fuel filter have been renewed, it will be necessary to eliminate air from the fuel system, especially the fuel injection pump.

1 Loosen the vent plug on the filter head of the pre-filter (A2). Operate the priming lever of the fuel lift pump (B) until fuel, free of air, comes from the vent plug. Tighten the vent plug.

Note: If the drive cam of the fuel lift pump is at the point of maximum lift, it will not be possible to operate the priming lever. In this situation, the crankshaft must be rotated one revolution.

Loosen the vent screw (A1) on the main filter. Operate the priming lever of the fuel lift pump until fuel, free of air, comes from the banjo bolt. Tighten the vent screw.

For filters with a separate element: Loosen the vent plug (C1) or banjo bolt on the top of the filter head.

2 Operate the priming lever of the fuel lift pump (B) until fuel, free of air, comes from the banjo bolt or vent plug. Tighten the banjo bolt or vent plug.
