Particle Theory and States of Matter

All the things we see are made of particles. There are three basic states of matter: solid, liquid and gas. Each state has different properties. The arrangement and movement of particles in each state is different. In solids, particles are packed closely together. In liquids, they are more spread out. In gases, they are very far apart and moving quickly.

Solids: Particles are packed closely together. They vibrate in fixed positions. They have strong forces of attraction between them. They have a definite shape and volume.

Liquids: Particles are more spread out than in solids. They can move past each other. They have weaker forces of attraction. They have a definite volume but no definite shape.

Gases: Particles are very far apart and moving quickly. They have very weak forces of attraction. They have no definite shape or volume.

Changes of State: Particles can change from one state to another. This happens when they gain or lose energy. For example, when a solid melts, it gains energy and the particles move more freely.

Crystals: Some solids are made of particles arranged in a regular pattern. These are called crystals. They have a definite shape and volume.
