

Chapter 7 - Membrane Structure and Function

- Hydrophobic substances are nonpolar molecules that do not have affinity for water molecules
- Substances that contain polar bonds are hydrophilic
- Membrane phospholipids
 - The polar heads interact with water; the nonpolar tails do not
- Most prokaryotic cells have no internal membranes; eukaryotic cells do

> Cellular membranes: a fluid mosaic of lipids and proteins

- Phospholipid is an amphipathic molecule: has both hydrophobic and hydrophilic regions
- Hydrophobic tails, hydrophilic heads
- Most membrane proteins are amphipathic
- Fluid mosaic model
 - The membrane is a mosaic of protein molecules bobbing in a fluid bilayer of phospholipids

> fluidity of membranes

- A membrane is held together mainly by hydrophobic interactions (much weaker than covalent bonds)
- Most lipids can shift about sideways, and rarely also flip flop across the membrane, switching from one phospholipid layer to another
 - The sideways movement is rapid
- Some membrane proteins move in a highly directed manner, or driven by motor proteins
- A membrane remains fluid as temp decreases until the phospholipids settle into a closely packed arrangement and the membrane solidifies
 - Phospholipids with unsaturated hydrocarbon tails remain fluid for longer
 - Because of the kinks in the tails where double bonds are located, unsaturated hydrocarbon tails cannot pack together as closely, making the membrane more fluid

- Steroid cholesterol can affect fluidity
- At high temps, cholesterol makes membrane less fluid by restraining phospholipid movement
- Cholesterol is a "fluidity buffer", resisting changes in membrane fluidity that can be caused by changes in temp
