Reading: [Genetic Variation in Cornelian Worksho](#) and genetic variation in [genetics](#) (complete each of the following questions, demonstrating your understanding of the concepts discussed in the lecture)

1. Match each of the following changes in DNA sequence structure to its definition:

A. Deletion

B. Duplication

C. Inversion

D. Translocation

1. a section of a chromosome is inserted

2. a piece of a chromosome is deleted

3. a segment of one chromosome has moved (inverted) to a different, non-homologous chromosome

4. a section of a chromosome appears to be on one chromosome but is really on another

2. How many genetically different gametes can be produced from a diploid cell with four chromosomes pairs? Describe your answer.

There are 16 genetically different gametes that can be produced because in 2ⁿ where n is total number chromosomes pairs, in this case with four chromosomes pairs we have 2⁴ which is 16 genetically different gametes

3. Although you will learn a classification of mutations that is useful, you recognize that some mutations cause the loss of function of a protein. For example, both color and eye color's ability may cause both the individual together?

Both mutations are linked together and found on the same chromosome. Therefore, they are recessive dominant alleles, and a heterozygous-dominant only cause either recessive dominant allele mutation will be dominant allele cause the mutation in the gametes, which, therefore, will be inherited together.

4. Describe the alignment of chromosomes during prophase I, write equations:

Homologous chromosomes I undergo crossing over and homologous chromosomes align together, called synapsis. This is a synapsis because it shows the pairing between sister and homologous chromosomes.

5. How does nondisjunction lead to chromosomal abnormalities? Describe two types of genetic disorders that can result from nondisjunction.
