Image Analysis and Recognition Mohamed Kamel, Aurélio Campilho, 2005-10-10 ICIAR 2005 the International Conference on Image Analysis and Recognition was the second ICIAR conference and was held in Toronto Canada ICIAR is organized annually and alternates between Europe and North America ICIAR 2004 was held in Porto Portugal The idea of organizing these conferences came as a result of discussion between researchers in Portugal and Canada to encourage collaboration and exchange mainly between these two countries but also with the open participation of other countries addressing recent advances in theory methodology and applications

The response to the call for papers for ICIAR 2005 was encouraging From 295 full papers submitted 153 were orally accepted 80 oral

presentations and 73 posters The review process was carried out by the Program Committee members and other reviewers all are experts in various image analysis and recognition areas Each paper was reviewed by at least two reviewers and also checked by the conference co chairs The high quality of the papers in these proceedings is attributed first to the authors and second to the quality of the reviews provided by the experts We would like to thank the authors for responding to our call and we wholeheartedly thank the reviewers for their excellent work and for their timely response It is this collective effort that resulted in the strong conference program and high quality proceedings in your hands

Feature Selection and Extraction Swair Rajesh Shah,2019 Feature selection is a very important process in statistics and machine learning It removes redundant and irrelevant features and selects the most useful set of features from a given dataset This tends to improve generalization of machine learning algorithms and reduces training time Feature selection is used to make the models more interpretable Recently it has been also used to reduce bias of such models and ensure fairness of the outcome Feature extraction is another dimensionality reduction process which finds a small set of features to approximate a given dataset Unlike feature selection in extraction the resulting features can be arbitrary functions of the features in the original dataset There are fast algorithms to compute feature extraction but it doesn't provide the interpretability aspect of feature selection and it tends to be less effective than feature selection in making models generalize better One of the problems addressed in this dissertation is a hybrid problem which combines feature selection and extraction This hybrid problem is at least as hard as feature selection which is known to be NP hard We show how simplistic sequential application of optimal selection and extraction does not provide an optimal solution for this problem We develop an algorithm to solve the hybrid problem optimally using methods inspired by the classic A search algorithm One of the most widely used feature extraction methods is the Principal Component Analysis PCA It is known to be very sensitive to the outliers in the data There have been various attempts in the literature to address this issue none promising an optimal solution to the problem We model this problem as a graph search problem and again apply our heuristic search framework to design an algorithm which solves this problem optimally We show that we compare favorably to the state of the art convex relaxation approach PCA is closely tied to a very popular linear algebra problem called the eigenvalue problem The third part of the dissertation uses the eigenvalue problem and a variant of it known as the generalized eigenvalue problem to achieve the privacy of the user data Today there are many companies which provide predictive models as services In order to use these services one needs to send one's data to such a service for prediction or inference It is possible that this data can be used to infer some confidential information about the data sender We design algorithms to apply transformations to this data so that the inference of the confidential information is prevented while the data can still be used to infer the desired information
