Kuiken, S.W. Rienstra, 2012-12-06 This book contains contributions by sixteen editors of a single journal specialised in real world applications of mathematics particularly in engineering These papers serve to indicate that applying mathematics can be a very exciting and intellectually rewarding activity Among the applied fields we note Thermal and Marangoni convection High pressure gas discharge lamps Potential flow in a channel Thin airfoil problems Cooling of a fibre Moving contact line problems Spot disturbance in boundary layers Fibre reinforced composites Numerics of nonuniform grids Stewartson layers on a rotating disk Causality and the radiation condition Nonlinear elastic membranes Acoustics in bubbly liquids Oscillation of a floating body in a viscous fluid Electromagnetics of superconducting composites Applied mathematicians theoretical physicists and engineers will find a lot in this book that will be of interest to them **Numerical Methods for Nonlinear Engineering Models** John R. Hauser, 2009-03-24 There are many books on the use of numerical methods for solving engineering problems and for modeling of engineering artifacts In addition there are many styles of such presentations ranging from books with a major emphasis on theory to books with an emphasis on applications The purpose of this book is hopefully to present a somewhat different approach to the use of numerical methods for engineering applications Engineering models are in general nonlinear models where the response of some appropriate engineering variable depends in a nonlinear manner on the variation of some independent parameter It is certainly true that for many types of engineering models it is sufficient to approximate the real physical world by some linear model However when engineering environments are pushed to extreme conditions nonlinear effects are always encountered It is also such extreme conditions that are of major importance in determining the reliability or failure limits of engineering systems Hence it is essential that engineers have a toolbox of modeling techniques that can be used to model nonlinear engineering systems Such a set of basic numerical methods is the topic of this book For each subject area treated nonlinear models are incorporated into the discussion from the very beginning and linear models are simply treated as special cases of more general nonlinear models This is a basic and fundamental difference in this book from most books on numerical methods **Mathematical Models in Engineering, Biology and Medicine** Alberto Cabada, Eduardo Liz, Juan J. Nieto, 2009-05-29 The Conference was focused in the Qualitative Theory of Differential Equations and its applications in a broad sense including Boundary Value Problems Existence Multiplicity Uniqueness Stability and Bifurcation Theory Different types of Differential Equations were treated namely Ordinary Partial and Functional Equations Applications
