

**Exercise 1.1.** Many centuries ago, a mariner poured  $100 \text{ cm}^3$  of water into the ocean. As time passed, the action of currents, tides, and weather mixed the liquid uniformly throughout the earth's oceans, lakes, and rivers. Ignoring salinity, estimate the probability that the next cup of water you drink will contain at least one water molecule that was dumped by the mariner. Assess your chances of ever drinking truly pristine water. [Some possibly useful facts:  $M_w$  for water is  $18.0 \text{ kg}$  per  $\text{kg-mole}$ , the radius of the earth is  $6370 \text{ km}$ , the mean depth of the oceans is approximately  $3.8 \text{ km}$  and they cover 71% of the surface of the earth. One cup is  $\sim 240 \text{ ml}$ .]

**Solution 1.1.** To get started, first list or determine the volumes involved:

$$v_d = \text{volume of water dumped} = 100 \text{ cm}^3, \quad v_c = \text{volume of a cup} \approx 240 \text{ cm}^3, \text{ and}$$

$$V = \text{volume of water in the oceans} = 4\pi R^2 D \gamma,$$

where,  $R$  is the radius of the earth,  $D$  is the mean depth of the oceans, and  $\gamma$  is the oceans' coverage fraction. Here we've ignored the ocean volume occupied by salt and have assumed that the oceans' depth is small compared to the earth's diameter. Putting in the numbers produces:

$$V = 4\pi(6.37 \times 10^6 \text{ m})^2(3.8 \times 10^3 \text{ m})(0.71) = 1.376 \times 10^{20} \text{ m}^3.$$

For well-mixed oceans, the probability  $P_c$  that any water molecule in the ocean came from the dumped water is:

$$P_c = \frac{(\text{100 cm}^3 \text{ of water})}{(\text{oceans' volume})} = \frac{v_d}{V} = \frac{1.0 \times 10^{-4} \text{ m}^3}{1.376 \times 10^{20} \text{ m}^3} = 7.27 \times 10^{-25}.$$

Denote the probability that at least one molecule from the dumped water is part of your next cup as  $P_1$  (this is the answer to the question). Without a lot of combinatorial analysis,  $P_1$  is not easy to calculate directly. It is easier to proceed by determining the probability  $P_2$  that all the molecules in your cup are not from the dumped water. With these definitions,  $P_1$  can be determined from:  $P_1 = 1 - P_2$ . Here, we can calculate  $P_2$  from:

$$P_2 = (\text{the probability that a molecule was not in the dumped water})^{(\text{number of molecules in a cup})}$$

The number of molecules,  $N_c$ , in one cup of water is

$$N_c = 240 \text{ cm}^3 \times \frac{1.00 \text{ g}}{\text{cm}^3} \times \frac{\text{gmole}}{18.0 \text{ g}} \times 6.023 \times 10^{23} \frac{\text{molecules}}{\text{gmole}} = 8.03 \times 10^{24} \text{ molecules}$$

Thus,  $P_2 = (1 - P_c)^{N_c} = (1 - 7.27 \times 10^{-25})^{8.03 \times 10^{24}}$ . Unfortunately, electronic calculators and modern computer math programs cannot evaluate this expression, so analytical techniques are required. First, take the natural log of both sides, i.e.

$$\ln(P_2) = N_c \ln(1 - P_c) = 8.03 \times 10^{24} \ln(1 - 7.27 \times 10^{-25})$$

then expand the natural logarithm using  $\ln(1 - \epsilon) \approx -\epsilon$  (the first term of a standard Taylor series for  $\epsilon \rightarrow 0$ )

$$\ln(P_2) \approx -N_c \cdot P_c = -8.03 \times 10^{24} \cdot 7.27 \times 10^{-25} = -584,$$

and exponentiate to find:

$$P_2 \approx e^{-584} \approx 10^{-254} \dots (!)$$

Therefore,  $P_1 = 1 - P_2$  is very-very close to unity, so there is a virtual certainty that the next cup of water you drink will have at least one molecule in it from the  $100 \text{ cm}^3$  of water dumped many years ago. So, if one considers the rate at which they themselves and everyone else on the planet uses water it is essentially impossible to get a truly fresh cup to drink.

principles of Young Munson and Okiishi's Third Edition of *A Brief Introduction to Fluid Mechanics*. The authors clearly present basic analysis techniques and address practical concerns and applications such as pipe flow, open channel flow, flow measurement, and drag and lift. Homework problems in every chapter, including open-ended problems, problems based on the CD-ROM videos, laboratory problems, and computer problems, emphasize the practical application of principles. More than 100 worked examples provide detailed solutions to a variety of problems. The Third Edition offers several new features and enhancements, including a variety of new simple figures in the margins that will help you visualize the concepts described in the text, Chapter Summary and Study Guide sections at the end of each chapter that will help you assess your understanding of the material, Simplified presentation of the Reynolds transport theorem, New homework problems added to every chapter, Highlighted key works in each chapter, Experience fluid flow phenomena in action on a new CD-ROM. The *Fluid Mechanics Phenomena* CD-ROM packaged with this text presents 75 short video segments that illustrate various aspects of fluid mechanics, 30 extended laboratory-type problems, Actual experimental data for simple experiments in an Excel format, 168 review problems.

*Fluid Mechanics* Frank M. White, 2003. The fifth edition of *FLUID MECHANICS* continues the tradition of precision, accuracy, accessibility, and strong conceptual presentation. The author balances three separate approaches: integral, differential, and experimental, to provide a foundation for fluid mechanics concepts and applications. Chapter 1 now provides a more student-accessible introduction to the field. After covering the basics in the first six chapters, the text moves on to applications with chapters on ducts, immersed bodies, potential flow, compressible flow, open channel flow, and turbomachinery. New material on CFD is included in Chapter 7 to give students a sense of its importance in modern engineering practice. The fifth edition includes a new problem-solving methodology introduced at the beginning of the book and used consistently in worked-out examples. 1,650 chapter problems are now included, organized into several problem types. Students can progress from general ones to those involving design, multiple steps, and computer usage. Word problems are included to build readers' conceptual understanding of the subject, and FE Exam problems in multiple-choice format are included. EES (Engineering Equation Solver) software is included so that students can effectively use the computer to model, solve, and modify typical fluid mechanics problems. A CD-ROM containing EES is free with every book, and Appendix E describes its use and application to fluid mechanics. A limited version of EES that does not expire is included on the CD-ROM. Users of the book can also download and distribute the full Academic Version of EES, which is renewed annually with a new username and password. In addition to the bound-in CD-ROM, a full Book Website is available for students and instructors. This contains an electronic Student Study Guide, interactive FE Exam questions, links to professional websites, PowerPoint slides of book figures, and a link to the EES website. A printed Solutions Manual is also available to adopters of the fifth edition.
