**Numerical Methods for Metamaterial Design** Kenneth Diest, 2013-08-19 This book describes a relatively new approach for the design of electromagnetic metamaterials Numerical optimization routines are combined with electromagnetic simulations to tailor the broadband optical properties of a metamaterial to have predetermined responses at predetermined wavelengths After a review of both the major efforts within the field of metamaterials and the field of mathematical optimization chapters covering both gradient based and derivative free design methods are considered Selected topics including surrogate base optimization adaptive mesh search and genetic algorithms are shown to be effective gradient free optimization strategies Additionally new techniques for representing dielectric distributions in two dimensions including level sets are demonstrated as effective methods for gradient based optimization Each chapter begins with a rigorous review of the optimization strategy used and is followed by numerous examples that combine the strategy with either electromagnetic simulations or analytical solutions of the scattering problem Throughout the text we address the strengths and limitations of each method as well as which numerical methods are best suited for different types of metamaterial designs This book is intended to provide a detailed enough treatment of the mathematical methods used along with sufficient examples and additional references that senior level undergraduates or graduate students who are new to the fields of plasmonics metamaterials or optimization methods have an understanding of which approaches are best suited for their work and how to implement the methods themselves

**Dynamic Behavior of Elastic Metamaterials** Chenchen Liu, 2018 Elastic Acoustic metamaterials have exhibited a rapid increase of interest due

to their surprising dynamic properties such as subwavelength bandgaps and negative effective elastic constant and or density The design and optimization of these novel architectures call for an enhanced understanding of the microstructure properties relations including micro inertia effects However similarly to regular composites their direct numerical simulation is often prohibitively time consuming and multiscale strategies that can consider the effect of the local microstructure under dynamic conditions and at the same time save computational time are in need We start by revisiting some fundamental theories in homogenization such as Hill s averaging relations and Hill Mandel condition initially derived under static loading We first prove that these fundamental relations hold exactly under finite element discretization i e no numerical error is introduced by the finite element discretization during the scale transition in the multiscale analyses and further discuss their extension to the dynamic setting Then we present a variational coarse graining framework for heterogeneous media under dynamic loading conditions which is applicable to general material behavior as well as to discrete or continuous representations of the material and its deformation e g finite element discretization or atomistic system The proposed theoretical framework can be used to perform multiscale numerical simulations in the spirit of multilevel finite element method FE2 which has been implemented with the help of an open source finite element library deal II Various time integration algorithms i e explicit and implicit Newmark methods have been employed and implementation in series and in parallel have been developed The resulting multiscale strategy has been tested for different applications namely layered materials and locally resonant structures with space time modulation In all cases comparisons with single scale finite element simulations showcase the efficiency and accuracy of the method Finally we also report a material architecture design based on locally resonant hierarchical structures to deliver metamaterial structures with enhanced bandwidth The theoretical analyses based on lattice systems are then certified using continuum models and finite element simulations The text and results in this thesis closely follow the articles by the author Liu Reina 2016 2017 2018a and Liu Reina 2018b
