Electric Power Systems Ned Mohan, 2012-01-18 Author Ned Mohan has been a leader in EES education and research for decades His three book series on Power Electronics focuses on three essential topics in the power sequence based on applications relevant to this age of sustainable energy such as wind turbines and hybrid electric vehicles The three topics include power electronics power systems and electric machines Key features in the first Edition build on Mohan s successful MNPERE texts his systems approach which puts dry technical detail in the context of applications and substantial pedagogical support including PPT s video clips animations clicker questions and a lab manual It follows a top down systems level approach to power electronics to highlight interrelationships between these sub fields It s intended to cover fundamental and practical design This book also follows a building block approach to power electronics that allows an in depth discussion of several important topics that are usually left Topics are carefully sequenced to maintain continuity and interest

Design, Modulation, and Control of Battery-Integrated Modular Multilevel Converters for Automotive Applications Arvind Balachandran, 2025-03-20 A critical component of a battery electric vehicle BEV is the battery pack which has many series and parallel connected electrochemical cells The total power energy delivered and lifetime of the battery pack are limited by the weakest cell in the pack Battery integrated modular multilevel converters BI MMC can overcome this limitation by increasing cell level control BI MMCs have several series connected DC to AC converters with a battery module having a few series and parallel connected cells called submodules SM The research in this thesis focuses on the design modulation and control of BI MMCs The efficiency and adaptability of five basic BI MMC topologies with half bridge and full bridge SMs across three main system configurations are presented Full bridge topologies offer high efficiency some even higher than the state of the art SiC two level inverter However adapting them to BEVs requires significant architectural modifications to the BEV s electrical system The half bridge topologies require fewer architectural modifications for adaption into the BEVs However they have lower efficiency and require a larger number of SMs which increases the cost The efficiency is increased with six phase system configurations but at the cost of more SMs than three phase system configurations Another aspect of adaptability is the DC charging capabilities of BI MMCs The maximum DC charging power of the BI MMCs with the same SM semiconductor losses as during traction is derived and results show that most BI MMCs have a maximum DC charging power of about 1MW Key design parameters that affect the efficiency and cost of BI MMCs are identified They are the number of series connected cells in an SM SM DC link capacitor energy and MOSFET switching frequency BI MMCs with five to seven

series connected cells per SM have the highest efficiency at an average power of 100 kW and considering phase shifted carrier based modulation Selecting the MOSFET switching frequency close to the resonant frequency of the SM DC link capacitors and the SM battery modules decreases the total efficiency Increasing or decreasing the MOSFET switching frequency increases the efficiency but affects the loss distribution between the SM DC link capacitors and the SM battery modules BI MMCs with nearest level modulation NLM have higher efficiencies than phase shifted carrier based modulation and the SiC two level inverter However using NLM with low frequency sort and select inter SM balancing methods sNLM results in an uneven distribution of battery losses among the SMs which may impact the thermal design Using NLM with cyclic submodule duty cycle rotation at the fundamental frequency gives higher efficiencies than sNLM and an even distribution of battery losses among the SMs Reconstruction of converter reference signals with a higher sample frequency at the submodule level can be used to adapt distributed control architecture to BI MMCs The advantage is the low communication burden between the central and the SM control units Furthermore the accuracy of the SM battery currents over one fundamental period is improved and the output distortion is low
